NOAA Sea Grant Advances Resilient Coastal Communities with \$4 Million in Support

Sea Grant programs across the U.S. are scaling up capacity to support additional hands-on, collaborative engagement to advance the sustainability of coastal and Great Lakes communities. Sea Grant awarded \$4 million in fiscal year 2023 funds to its grant-based programs nationwide to continue or expand ongoing work or address new opportunities for coastal climate adaptation and resilience for the communities that Sea Grant serves.

In recognition of growing needs, the \$125,000 per funded program was made possible with the support of Congress. These adaptation and resilience funds are further leveraged by additional program funds and at least 50 percent matched partner contributions, among a broader set of relevant Sea Grant awards.

The funded projects include support for engagement, knowledge sharing, research, technical assistance, decision support, project implementation, and partnership coordination and collaboration to help address community adaptation and resilience needs, along with support for resilience-focused staff capacity. This work also includes engagement with tribal, Indigenous, remote, and economically disadvantaged communities.
