The tornado initially began in a heavily wooded area northeast of Gabriel Creek Rd and tracked northeast. Radar imagery suggests the tornado quickly intensified. Farther downstream, significant timber damage was observed on County Rd 50, as well as National Forest Rd 706. This timber damage was quite impressive and very wide at many points with both hardwood and softwood trees snapped and uprooted. The magnitude of timber damage suggested winds of 140 mph. The tornado continued northeast causing further damage to a large swath of the Talladega National Forest in far northeast Hale County. The tornado crossed into southeast Tuscaloosa County very near the northwest tip of Bibb County.

National Weather Service meteorologists surveyed damage in northeast Bibb County and determined that it was consistent with an EF2 tornado, with maximum winds near 115 mph.

This tornado touched down formed along Highway 24 west of Highway 5. The tornado tracked northeast, crossing Highway 5 northwest of the community of West Blocton, causing tree and shingle damage. The tornado strengthened to EF2 intensity as it continued northeastward into a wooded area where numerous trees were snapped. The tornado weakened as it crossed into Shelby County south of Shelby County Highway 13, continuing to uproot trees.

National Weather Service meteorologists surveyed damage in northern Shelby County and determined that it was consistent with an EF3 tornado, with maximum winds near 140 mph.

This tornado originated in Bibb County and crossed into Shelby County along Shades Creek west of River Road. The tornado traveled northeast in a wooded area along the Cahaba River, paralleling County Highway 13. As the tornado moved into Helena, it caused shingle damage to several homes in the neighborhoods near Old Cahaba Parkway and Hillsboro Parkway. A house that was under construction also collapsed. The tornado intensified again as it crossed Buck Creek near Old Town Helena, snapping numerous trees and causing roof damage. A few homes near Cunningham Drive suffered partial roof loss. The tornado weakened as it crossed New Hope Mountain near Pelham High School, but intensified to EF2 intensity along Crosscreek Trail and Wilderness Road in Pelham. Roofs were removed from four homes with collapse of an exterior wall on two of them, with many other homes suffering varying degrees of roof damage. The tornado also caused several trees to fall on homes in the Chandalar neighborhood. The tornado weakened somewhat by the time it crossed Highway 31 but still damaged the roofs of several businesses and mobile homes while uprooting trees. It began to strengthen again after crossing Interstate 65, paralleling Highway 119 through the south side of Indian Springs Village and far northern portions of Oak Mountain State Park. It continued to uproot or snap numerous trees and continued to cause roof damage to residences. Pockets of EF2 damage were found in neighborhoods south of Heardmont Park and near Oak Mountain Elementary and Intermediate Schools, with significant damage to residences from falling trees and partial roof loss. Significant timber damage with some damage to structures was also noted near the lakes at the north gate to Oak Mountain State Park. The most significant structural damage along the path occurred in the Eagle Point neighborhood just before Highway 280. Several homes suffered complete roof loss, a couple homes suffered collapse of exterior walls, and all walls collapsed for one home on Eagle Valley Drive. The majority of the other homes in the path in this neighborhood suffered varying degrees of roof damage, with numerous trees snapped. After crossing Highway 280, the tornado continued to uproot numerous trees as it moved over Oak Mountain. It caused roof damage along Highland View Drive and in the Highland Lakes neighborhood, including complete roof loss to a residence on Grove Park Way. Varying degrees of roof damage also occurred in the Greystone Farms neighborhood, with significant roof loss on several homes. The tornado crossed Dunnavant Valley Road and caused significant timber damage at Shoal Creek Country Club, and complete roof loss for another residence. The tornado then moved into a wooded area as it crossed Double Oak Mountain, continuing to uproot numerous trees. It crossed Highway 25 near Vandiver and then began to parallel Shelby County Highway 43, causing roof damage to residences and completely destroying a manufactured home on Crabapple Lane. The tornado crossed into St. Clair County near Wolf Creek Road.

National Weather Service meteorologists surveyed damage in Calhoun County and determined that it was consistent with an EF3 tornado, with maximum winds near 140 mph.

The tornado first touched down on Boiling Springs Road snapping and uprooting trees just north of Mitchellville Road. The tornado widened as it traveled northeast damaging structures along Boiling Springs Road, downing trees and power lines. A double wide mobile home was demolished on Simpson Bend Road. The tornado then produced extensive damage in the Macon community, destroying numerous mobile homes with moderate to major damage to several site built homes. In this area, tree damage was also extensive with numerous hardwoods snapped near the base along Ragan Chapel Road. As the tornado approached Highway 77, it reached its maximum intensity and was likely multi-vortex in nature based on the damage pattern. Here, a large swath of trees were snapped. A large factory, Precision Materials, sustained major damage. The entire structure and supporting frame of this large well built metal building was collapsed and bent inward. The owner said they received the tornado warning and moved all employees into a safe shelter in the interior of the building before the tornado hit. None of the occupants were injured. A large tractor trailer at this location was also partially lofted and then dragged 60 feet. The damage at this location was rated EF-3. The tornado crossed County Road 77, with damage to several homes along Ragans Chapel Road. At least two homes sustained significant damage with most of their roof removed and windows blown out. A large farm building was also demolished. Ragans Chapel UMC, a structure dating back to the late 1800s, sustained major damage with most walls collapsed. The caretaker's home behind the church sustained major damage.

Along Mudd Street, several mobile homes were completely destroyed. A fatality occurred in one unanchored tiny home when the structure completely collapsed. Additional site built homes in the area from Mudd Street to Lost Creek Road sustained significant damage. The tornado continued northeast over mainly forested areas snapping and uprooting large swaths of trees. A wide expanse of damage was noted from Dark Hollow Road and Boiling Springs Road. Here many power lines were downed and poles snapped. Several site built homes sustained roof and structural damage, farm buildings and sheds were destroyed, and a mobile home was completely destroyed.

Significant damage was noted along Ingram Wells Road and Grayton Road South. Along Ingram Wells Road several homes were damaged and outbuildings destroyed. Along Grayton Road several mobile homes were destroyed with the undercarriages and contents blown well downstream. A doublewide mobile home also sustained significant damage. Three fatalities occurred here along with multiple significant injuries. A wide swath of tree damage continued along Grayton Road South and Mountain View Road.

The tornado then moved into the Wellington community as it crossed US Highway 431. Here several site built homes sustained moderate damage with partial loss of roof structures. Many power poles were also snapped along with damage to a convenience store. Significant damage was noted along Joe Martin Drive and Wellington Road. One site built home sustained collapse of most walls and cars were tossed. Six occupants sheltered safely in an interior closet. Additional homes sustained roof damage with one moved well off its foundation. Several mobile homes were completely destroyed. One occupant was killed near Mangum Road, but 13 others survived after sheltering in a family storm pit.

A wide swath of damage continued from East Wellington into Pleasant Valley with mobile homes destroyed along Old Sulphur Springs Road and site built homes with roof and structural damage. Trees were snapped and uprooted along County Road 204 along with damage to structures. Chicken houses were destroyed along Pleasant Valley Road, along with substantial damage to a church and business along Angel Drive. The tornado continued northeastward where additional damage was observed along Nisbet Lake Road, Dogwood Lane, and Charlie Penny Road. This was mostly timber damage where the tornado uprooted and snapped hundreds of trees. Varying degrees of minor structure damage was observed here as well. Farther northeast, the tornado moved toward New Liberty and Roy Webb Rd where damage was sustained at Learning Tree. The tornado continued northeast crossing Old Piedmont Gadsden Highway and US Hwy 278. Several swaths of timber damage was observed throughout these areas as well as minor damage to a few homes. The tornado crossed into southern Cherokee County just west of Highway 9.

of each tower. Either way, a powerful tornado occurred. Residential damage included wall collapse, roofing torn off, shifting off of foundation, or total

structural loss. There were six minor injuries in Hale County.

A strong, long-track tornado traveled across Hale, Perry, Bibb, Chilton, and Shelby Counties during the afternoon of March 25, 2021. It is estimated that the tornado had a 98 minute life span, with a path length of 80 miles. The tornado crossed from Hale into Perry County near County Road 51. A mobile home was destroyed with a site built home on the same property sustaining roof loss and some shifting of the crawl space foundation. Structural damage was most apparent in the vicinity of the confluence of County Road 23 and Old Salem Church Road. In this area, mobile homes were destroyed, with one site built home having roof loss and exterior wall failure, with another sustaining roof loss and some warping of the wood framing from wind entry. A nearby church had roof loss with an adjacent metal building sustaining a lot of damage consisting significant peeling of paneling and structure warping from wind entry. Other structural damage occurred along the path as well. The tornado crossed into Bibb County Road just south of County Road 44.

National Weather Service meteorologists surveyed damage in eastern Jefferson County and determined that it was consistent with an EF1 tornado, with maximum winds near 90 mph.

A tornado touched down near the intersection of 8th Ave South and 85th Street South in the South Eastlake and South Highlands neighborhoods of Birmingham. It traveled northeast into the South Roebuck neighborhood uprooting numerous trees. It made a jog eastward as it crossed the northern end of Ruffner mountain, continuing to uproot and snap numerous trees as it traveled between Highway 11 and Interstate 59 in the Roebuck Plaza neighborhood. The tornado crossed Interstate 459 and dissipated as it reached the Jefferson Memorial Gardens on the southwest side of Trussville. Around forty-two homes were damaged, almost all by uprooted trees.

National Weather Service meteorologists surveyed damage in southern Bibb County and determined that it was consistent with an EF3 tornado, with maximum winds near 150 mph.

A strong, long-track tornado traveled across Hale, Perry, Bibb, Chilton, and Shelby Counties during the afternoon of March 25, 2021. It is estimated that the tornado had a 98 minute life span, with a path length of 80 miles. The tornado crossed into Bibb County from Perry County just south of County Road 44. There were three primary areas of concentrated structural damage in Bibb County. Along Belcher Road, anchoring to a metal building used for farm equipment failed, sending the structure crashing into an adjacent house. Across the field, a site built home had sections of roof removed and its open face garage blown away, with an adjacent farm building collapsed. In Centreville city limits, snapped trees were prevalent near the Cahaba River. Along Montgomery Road east of town, heavy damage occurred where trees were debarked. Mobile homes were crushed by fallen trees and site built homes had roof damage. In the town of Ashby, along Buzzard Road, several mobile homes were destroyed. Anchoring was not apparent, though at least one of the mobile homes was thrown a fair distance. Site built homes on the same street suffered light to heavy roof damage but were still standing. The tornado crossed into northwest Chilton County just south of County Road 108. There were five minor injuries in Bibb County.

National Weather Service meteorologists surveyed damage in southeast Shelby County and determined that it was consistent with an EF1 tornado, with maximum winds near 110 mph. A strong, long-track tornado traveled across Hale, Perry, Bibb, Chilton, and Shelby Counties during the afternoon of March 25, 2021. It is estimated that the tornado had a 98 minute life span, with a path length of 80 miles.

The tornado crossed into Shelby County from Bibb County near the intersection of County Road 201 and 128. The tornado moved into the city of Calera, uprooting trees and blowing over an unanchored mobile home along County Road 67. The tornado then crossed Interstate 65 and moved into a large neighborhood along and northeast of Timberline Drive. The majority of structural damage was confined to loss of shingle and siding. However, at least 3 homes had portions of their roofs removed, 2 of them with significant loss. Next, mostly rural areas were hit between the cities of Columbiana and Calera, south of Highway 70. The last area of notable damage was in Columbiana. Numerous trees were uprooted from Mooney Road to Mardis Ferry Road and numerous homes were heavily damaged by fallen trees. Several mobile homes were impacted near the intersection of Alston Farm Road and Mardis Ferry Road. Most sustained roofing damage or were crushed by fallen trees. One unanchored mobile home was destroyed with 2 injuries that required hospitalization. Other structures were damaged along the path as well. The tornado then quickly weakened, and dissipated as it approached Highway 25 after crossing County Road 7.

MARENGO COUNTY 3.7 W NANAFALIA [32.12, -88.04], 1.8 SE HALF ACRE [32.18, -87.90]

National Weather Service meteorologists surveyed damage in southwest Marengo County and determined that it was consistent with an EF2 tornado, with maximum winds near 115 mph.

The tornado crossed the Tombigbee River from Choctaw County just south of Highway 10. It produced significant damage on South Riverview Lane, just south of Alabama Highway 10. In this area, an older single wide mobile home was destroyed with the frame tossed at least 50 yards to the east. In addition, a large storage building was also destroyed. Significant tree damage was noted in the area with several hardwood and softwoods snapped and uprooted. In this area, the tornado is estimated to have been at low end EF2 intensity with winds around 115 mph. The tornado continued northeast and crossed Highway 10, producing substantial tree damage and also heavily damaging one barn and destroying another. The tornado continued to produce substantial tree damage as it crossed Highway 69. As the tornado moved east of Highway 69, the road network did not allow the survey team to assess the damage over a large forested area. However, damage was noted along Highway 17, north of Beaver Creek Road. It is not known how much farther to the northeast the tornado continued due to no road access, but the tornado did not reach Highway 43.

National Weather Service meteorologists surveyed damage in southeast Chilton County and determined that it was consistent with an EF2 tornado, with maximum winds near 120 mph.

The tornado first touched down along CR 495, just east of Clanton, with minor tree damage. The tornado traveled east northeast producing mainly minor tree damage and some structural damage as it crossed CR 97. The tornado then tracked across mainly inaccessible forest land before producing notable tree damage along CR 480 before tracking over several homes along Lake Mitchell, south of County Road 472. Most of the homes had minor roof damage or sustained more damage from fallen trees. One home off of County Road 481 had a garage completely collapse. There were also numerous hardwood trees snapped near the pumphouse on County Road 474. Near this point, the tornado reached its maximum intensity. The tornado then crossed Lake Mitchell into Coosa County.

National Weather Service meteorologists surveyed damage in southwest Coosa County and determined that it was consistent with an EF2 tornado, with maximum winds near 115 mph.

Substantial tree damage, with many hardwood and softwood trees snapped, was noted along Little Airplane Road, CR 121, and Bluff Road. Several houses along Little Airplane Road had roof and structural damage with one right along the lakefront sustaining more substantial damage. A home along Bluff Road appeared to lose much of its roof, top floor, and walls. At this point, the tornado reached its maximum intensity. The tornado continued to travel northeast along the far southern extent of Lake Mitchell producing tree damage and some structural damage along the lakeshore. The tornado weakened notably as it moved east of Lake Mitchell with more minor tree damage noted along CR 29. The tornado snapped some limbs along CR 118 before dissipating just east of Herb Valley Drive.

National Weather Service meteorologists surveyed damage in rural northern Tallapoosa County and determined it was consistent with an EF1 tornado with maximum winds near 95 mph. The tornado first touched down in a remote area just east of Goldville, starting out very narrow but producing significant areas of uprooted trees and a distinct debris signature as it passed over harvested and unharvested forests. The tornado crossed Simpson Road before passing into Clay County.

CLAY COUNTY 2.7 WSW SKESVILLE [33.11, -85.72], 1.4 NE MOTLEY [33.14, -85.65]					
03/25/21 20:58 CST	0	Tornado (EF2, L: 4.54 mi , W: 1000 yd)

National Weather Service meteorologists surveyed damage in southeast Clay County and determined that it was consistent with an EF2 tornado, with maximum winds near 125 mph.

This tornado originated in Tallapoosa County and crossed into Clay County southwest of Sikesville. As the tornado crossed Hodge Creek Road, it produced extensive timber damage, specifically the snapping and uprooting of large swaths of trees. Some minor structural damage was also noted in this area. The tornado traveled northeast producing extensive tree damage in the Sikesville community where numerous homes here received minor to moderate roof damage. One home sustained major damage with all but one wall collapsed. The tornado nearly paralleled County Line Road as it moved into southwest Randolph County.

National Weather Service meteorologists surveyed damage in southwest Randolph County and determined that it was consistent with an EF2 tornado, with maximum winds near 125 mph.

This tornado originated in Clay County and crossed into Randolph County just south of Bald Rock Road. All along CR 836, swaths of hardwood trees were either uprooted or snapped. The tornado widened as it approached CR 77. Here the tornado carved a wide path over mainly forested areas with some damage to barns and agricultural buildings. A chicken house on CR 845 was completely destroyed.

Substantial damage was noted in the Corinth community in southwest Randolph county. Along CR 43, a row of homes had minor to moderate damage. Many homes in this area sustained complete loss of roof structure and blown out windows. The Corinth Fire Department was also damaged in this area.

The tornado continued to travel northeast, snapping trees and powerlines along CR 33 and CR 26. Homes in this area also received damage, mostly to roof structures. Homes were damaged along CR 65 just west of US Highway 431. Once the tornado crossed Highway 431, it produced extensive damage to homes and structures along CR 61 and CR 700. Several homes had their roofs removed and trees were snapped near the base. Farther east near CR 59, a 100 year old log cabin was mostly destroyed with only a couple of walls left standing. Tree damage in this area was also extensive.

Additional trees and power lines continued to be snapped along CR 16 and CR 87. A large farm building was destroyed near CR 701 and several chicken houses were also destroyed in this area. The tornado weakened notably east of CR 87 before lifting near CR 296 just west of the Georgia state line.

A potent storm system affected Central Alabama on Thursday, March 25th. A highly-sheared environment combined with increasing instability produced numerous tornadic thunderstorms. Severe parameters were supportive of significant and long-track supercells, prompting the issuance of a rare "High Risk" Convective Outlook from the Storm Prediction Center for portions of Central Alabama.

A total of 10 tornado tracks were surveyed in Central Alabama. This included 4 EF3 tornadoes, 3 EF2 tornadoes, and 3 EF1 tornadoes. Damage was significant along the paths of the most intense tornadoes and, unfortunately, injuries and fatalities occurred. Some storms were cyclic, meaning multiple tornadoes were produced by the same storm. The most impressive tornado of the event was the long-track tornado that traveled nearly 80 miles from Hale County to Shelby County. This ranked as the seventh longest single tornado track in the state of Alabama.

Several trees uprooted and power lines downed along Highway 119 near Grants Mill Road.

A strongly sheared and moist air mass resided over north Alabama during the afternoon hours on March 27th. Isolated strong to severe storms develop along and north of I-20 during the heating of the afternoon. A cold front then pushed through Alabama during the early morning hours on March 28th. A line thunderstorms ahead of the front also produced isolated strong to severe storms.

National Weather Service meteorologists surveyed damage in southern Marion County and determined that it was consistent with an EF0 tornado, with maximum winds near 80 mph.

The tornado began in a wooded area just north of Stakehouse Road where several large branches were broken. The tornado then traveled northeast where it crossed I-22 and the intersection of Berryhill Road and Highway 278. In this area, several softwood trees were uprooted and additional large branches were broken. The tornado continued northeast into a deforested area and lifted.

National Weather Service meteorologists surveyed damage in eastern Winston County and determined that it was consistent with an EF1 tornado, with maximum winds near 90 mph.

The tornado began just west of County Road 146 where several large branches were broken from a pine tree. The tornado traveled northeast through a wooded area where it snapped and uprooted multiple softwood trees. At the intersection of Helicon Road and County Road 146, various types of structural damage was observed, including the near total removal of a metal barn roof and significant loss of roof covering on a site-built home. A carport that was attached to the home was completely destroyed. The tornado then took an easterly turn through an open field producing minor tree damage and removing a few metal roof panels from a barn before crossing into Cullman County.

	03/31/21 07:16 CST		0	Source: NWS Storm Survey

National Weather Service meteorologists surveyed damage in southeast Blount County and determined that it was consistent with an EF0 tornado, with maximum winds near 80 mph.

The tornado touched down just west of Armstrong Loop and initially snapped several large branches and uprooted several large pine trees in the front yard of a residence. The tornado traveled into a wooded area nearly parallel to Russell Drive where a few more softwood trees were uprooted and large branches snapped. The tornado lifted at the end of Russell Drive just before crossing Hayes Creek.

A warm front moved pushed northward into north Central Alabama late on March 30th and into the early morning hours on March 31st. A low pressure area developed along the warm front and tracked from west to east across northern Alabama. This feature pooled instability just south of the front and added just enough shear for some rotating and organized storms. Subsequently, three weak and short-lived tornadoes developed. Due to the strong southerly winds and lift near the front, heavy rainfall was observed across northern Alabama. Widespread amounts of 1 to 3 inches of rain were observed with localized amounts of 5 to 6 inches west of I-65. These amounts produced flash flooding in several locations where roads were washed out and or became impassable. Additionally, many local creeks and streams flooded and this eventually lead to river and lake flooding.

flash flooding. Flash flooding closed a portion of I-65 in Cullman and several other roads were flooded or washed out in Cullman County. Also, isolated large hail and damaging winds were reported with a couple of these thunderstorms in northeast Alabama. During the afternoon hours, additional strong thunderstorms produced additional excessive rainfall resulting in more flooding. Rainfall totals were

		Injuries	Crop Dmg	

The tornado first began east of Wicksburg and east of the Houston/Geneva county line where scattered tree limbs where reported by the emergency manager. The tornado then strengthened and hit several structures on a farm where damage was confined to ripped roof paneling and other similar damage. The tornado then traveled northeast towards US-84. It was in these locations that the tornado was likely at its peak strength as it moved across Marshall Rd and into the Highlands Subdivision along Highway 84. Along Marshall Rd, a double wide sustained significant roof covering loss, a large carport over a RV was completely destroyed, and a out building nearby was missing nearly its entire roof with some walls partially collapsed. The tornado also briefly picked up a boat, with trailer, and rolled/rotated it 180 degrees on the trailer before being laid to rest nearly 75-100 yards from its original location. EF-1 damage was again observed in the Highlands Subdivision south of US Highway 84. Two homes sustained roof damage with one home sustaining partial roof loss on the second story. Many pine trees near this house were also snapped or uprooted. While these were the only homes with notable damage in the community, there was a path of widespread tree damage through the rest of the neighborhood. The tornado then crossed US-84 where damage became more isolated with a few downed trees and broken branches. The tornado is then estimated to have lifted just northeast of North Brannon Stand Rd. Max winds were estimated around 100 mph. The NWS thanks Houston County EM Chris Judah for his assistance during this survey.

An EF0 tornado touched down in northwestern Houston County near Cedar Creek. Small trees and branches were snapped along Faulkner Rd and Suggs Rd. A carport on Suggs Rd sustained damage. The tornado then tracked northeast into Henry County, snapping some small trees and branches along Burdeshow Rd before lifting just south of Headland. Max winds were estimated around 80 mph.

The tornado first touched down at the corner of Glenwood Road and Melvin Wallace Road where it snapped an area of trees. The tornado then continued northeast across Nelvin Wallace Road where to reached peak intensity snapping several pines, uprooting several oak trees and removing the roof of an out building. Eventually the tornado lifted just south of N Brunson Chapel Road but nor before snapping a few more pine trees.

A strong cold front moved through the southeast states, triggering a severe weather outbreak that produced several tornadoes along with numerous reports of large hail and damaging winds.

The exceptional (D4) and extreme (D3) drought categories continued across a large part of southeast Arizona during March, with the exception of western Pima County. Precipitation totals for the month totaled 0.5 to 1.5 inches in some areas or 75 to 125 percent of normal, but many areas only received between 0.1 and 0.5 inch, or 15 to 75 percent of normal. Soil moisture readings remained very low, below the 5th percentile ranking across Santa Cruz, eastern Pima and Pinal and western Graham counties and below the 10th percentile ranking elsewhere. Levels at San Carlos Reservoir fell to less than 1 percent of storage capacity. Around 20 small wild land fires occurred during the month, but all were quickly suppressed.

(AZ-Z505) SOUTH CENTRAL PINAL COUNTY
03/03/21 14:15 MST 50K Dust Storm
03/03/21 15:45 MST 0

Strong winds created areas of blowing dust that reduced visibility to less than a quarter mile and resulted in a multi-vehicle accident and closure of Interstate 10 in Pinal County. Several injuries to motorists occurred.

wind gusts were measured upward dust in Pinal and eastern Maricopa and a residence in Apache Junction	s of 45-55 mph from late morning through the aft counties. The winds and dust created difficult to n saw minor roof damage. A wind advisory and s	ternoon. The winds pro o dangerous travel cond	duced widespread blowing litions, especially along I-10,	

surface wind gusts up to 35-45 mph, which was strong enough to create patchy blowing dust and even a dense channel of blowing dust in northwest Pinal county in the afternoon. The channel of dust blew across Highway 347 north of Maricopa and lowered visibility to 0.25 miles or less. No accidents were reported.

Two to more than three inches of rain dumped from Newport (Jackson County) to North Little Rock (Pulaski County). Vehicles stalled in high water, and people had to be rescued. Several roads were closed. Water was also over roads in North Little Rock and Sherwood (both in Pulaski County). At the latter location, a pond near a police station overflowed, and there was water everywhere.

At Searcy (White County), lightning struck a clinic and caused damage to electronic equipment. Power was knocked out to the facility temporarily.

A longwave trough shifted east out of the Rockies and into the Central and Southern Plains during the day on March 27th, with the southwest flow ahead of the trough ejecting a series of upper level disturbances northeast across Northeast Texas, Southwest Arkansas, and Northwest Louisiana during the afternoon and evening. Meanwhile, a broad warm and moist sector had spread north across all of the Ark-La-Tex into Eastern Oklahoma and much of Arkansas ahead of this trough, with temperatures warming into the upper 70s and lower 80s areawide. This resulted in moderate instability developing as large scale forcing increased during the late afternoon through the evening hours, resulting in scattered to numerous shower and thunderstorm development across much of these areas. Increasing wind shear late in the afternoon also promoted the development of scattered severe thunderstorms over East Texas, Southwest Arkansas, and Northwest Louisiana, with various reports of damaging winds and large hail received. These storms eventually organized along a broken line as it pushed into North Louisiana, ahead of a cold front that shifted southeast into the area during the early morning hours of the 28th.

Northern California typically experiences a wet season, October through May, and a dry season May through September. Last year's water year, October 2019 through September 2020, was one of the driest on records. This likely contributed to the U.S. Drought Monitor's decision to place portions of interior northern California into extreme drought on September 29, 2020. Portions of Shasta,

ocation	Date/Time	Deaths & Injuries	Property & Crop Dmg	Event Type and Details	
ehama, Butte, Glenn, Colusa, Yolo, Sol orthern California was placed into seve ocations are in drought.			•	•

A large upper-level trough slowly evolved south and eastward over the northeast Pacific Ocean during early to middle portions of March. Multiple waves of showers spread inland across northwest California as a result. Accumulating snowfall occurred across the mountains with the passing showers, while isolated instances of small hail were observed at sea level along the coast.

Strong Wind (MAX 39 kt)

Location	Date/Time	Deaths & Injuries	Property & Crop Dmg	Event Type and Details

A Pacific low pressure system moved into northwest California during the morning of March 15 and dropped southeast into central California during the afternoon spreading widespread precipitation over the area. Much of the San Joaquin Valley picked up another quarter to half inch of rainfall while the Sierra Nevada and adjacent foothills received a half inch to an inch of liquid precipitation north of Kings Canyon and three to six tenths of an inch south of Kings Canyon. The snow level was close to 4000 feet and areas aboved 4000 feet picked up 5 to 10 inches of snow north of Kingsd Canyon and 3 to 6 inches of snow south of Kings Canyon. Between a tenth to a quarter inch of liquid precipitation fell in the Kern County Mountains with up to an inch of new snowfall being measured at pass levels. Black ice once again resulted in brief closures of the Tejon and Tehachapi passes. The Kern County Deserts generally received a tenth of an inch or less of rainfall, but strong downslope winds during the evening March 15 impacted Kern County as there were several reports of gusts exceeding 60 mph and a few low impact indicator sites measured gusts in excess of 75 mph. There were also some reports of wind damage in the Bakersfield area as there were several stations which picked up gusts between 35 and 45 mph. The low moved east of the area during the morning of March 16 resulting in decreased winds and precipitation tapering off.

(CA-Z195) LAKE ISABELLA, (CA-Z196) TEHACHAPI AREA		
03/20/21 13:10 PST	0	High Wind (MAX 56 kt)
03/20/21 16:14 PST	0	

An upper trough moved into the Pacific Northwest and northern California on March 19 and deepened over the region on March 20. This resulted in a warm and moist airmass impacting central California producing widespread precipitation on March 19 and 20. Several stations in the Sierra Nevada picked up between 0.75 and 1.50 inches of liquid precipitation which was mainly in the form of rain below 8000 feet before snow levels lowered on March 20 before the precipitation ended. Much of the San Joaquin Valley picked up between 2 and 4 tenths of an inch of rainfall. The mountains and deserts in Kern County generally picked up less precipitation with most mountain locations pickeing up between a tenth and a quarter inch of rainfall and the deserts picking up a tenth of an inch or less. The main impact from this system; however, was post frontal winds in Kern County. Several stations in the Kern County Deserts and in the Tehachapi and Lake Isabella areas measured gusts between 40 and 50 mph. A few low impact indicator sites briefly measured gusts above 57 mph on March 20. The winds diminished during the morning of March 21 as the trough moved east of the area.

(CA-Z198) INDIAN WELLS VALLEY				
	03/23/21 19:26 PST	0	High Wind (MAX 53 kt)	
	03/23/21 19:26 PST	0		

A strong upper level trough dropped from the Pacific Northwest into the Great Basin on March 23 which resulted in strong pressure gradients over the Sierra Nevada. This resulted in a period of strong northeast wind gusts over the Sierra Nevada and adjacent foothills where several stations measured gusts in between 45 and 55 mph between the late morning and the evening. In addition, strong northerly winds developed over the Kern County Deserts duiring the evening of March 23 and a few low impact indicator stations measured gusts above 55 mph. The winds diminished on March 24 as the trough moved east of the area and gradients relaxed.

(CA-Z196) TEHACHAPI AREA			
	03/29/21 16:27 PST	0	High Wind (MAX 59 kt)
	03/29/21 16:27 PST	0	

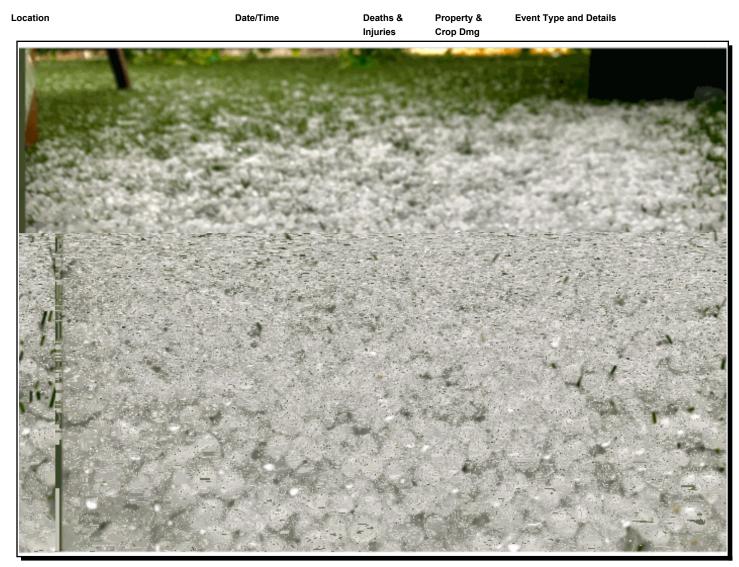

A low pressure system dropped southward through the Great Basin on March 29 pushing a dry cold front through central California during the afternoon and evening hours. This produced a period of gusty winds across the Kern County Deserts as well as in the Tehachapi and Lake Isabella areas. Several stations briefly measured gusts exceeding 45 mph. The winds diminished by late evening as the low moved well to the east of our area.

Thunderstorms late afternoon on March 11 produced 1/4 to 1/2 inch hail.

A West Coast trough of low pressure impacted Southern California March 9th through 13th. This storm brought periods of windy conditions across the mountains and deserts, along with widespread rain and snowfall, and areas of flooding and debris flows being observed as well.

03/11/21 18:00 PST

Webcameras showed the snow on the ground in San Diego mountains on March 11.

			-	

There was a significant improvement in the drought status for East Central Colorado due to widespread rainfall during the month. The much needed rainfall caused the drought status to improve to D1 Moderate Drought for most of East Central Colorado. There was even a small area of D0 Abnormally Dry for eastern Kit Carson County and part of southern Yuma County. Despite the much needed rainfall, the western half of Cheyenne and far west Kit Carson County only improved to D2 Severe Drought.

As an upper level system moved across the region, southern Colorado observed widespread snow showers across the mountains,

	Storm Data and Unusual	Weather Ph	enomena -	March 2021
Location	Date/Time	Deaths & Injuries	Property & Crop Dmg	Event Type and Details

occasionally spilling into most interior valleys and the I25 corridor. The snow did eventually push further east along the Colorado and New Mexico border, with locations along the southeast plains observing the heavier snow. Highest totals during this time frame were around one to two feet of snowfall.

03/31/21 23:59 MST	0	

0

Drought conditions improved slightly across portions of southwest Colorado in response to areas of below normal temperatures and above normal precipitation during the month of March. Elsewhere, drought status remained unchanged through the end of March as a result of drier and warmer than normal conditions.

0	Winter Weather
0	
	0 0

Moisture wrapped around an upper level low centered near the Four Corners area led to a quick shot of moderate snow for the southwest San Juan Mountains.

(CO-Z002) CENTRAL YAMPA RIVER BASIN, (CO	D-Z004) ELKHEAD AND PARK MOUNTAINS			
	03/09/21 20:00 MST	0	Winter Weather	
	03/10/21 12:00 MST	0		

A series of weak disturbances trekked across western Colorado. Favorable northerly winds led to strong orographic snow showers over the Elkhead, Park and Gore Mountain ranges. Winds gusted up to 55 mph at times. Additionally, steep lapse rates and instability associated with the secondary wave led to stronger snow bands along portions of Colorado Highway 40. Winds likely gusted to 30 mph with a snow squall that impacted the highway from Hayden towards Steamboat Springs. Visibilities were reduced to a quarter mile or less in the squall.

A National Weather Service survey determined that an EF4 tornado with maximum wind speeds 170 MPH and a maximum path width of 1850 yards occurred in Coweta County. The Heard County tornado crossed into Coweta County along Bob Wilson Road and gained strength as it moved east-northeast crossing JD Walton Road and travelled up Smokey Road with trees falling on some homes. Wind speeds quickly increased to over 150 MPH, EF3 intensity, near Timberland Trail on the southwest side of Newnan. Many homes had major damage and one home had all but the back wall collapse. The family survived with no injuries by taking shelter in their bathtub. The tornado continued east-northeast crossing Smokey Road and Belk Road where it reached its maximum intensity of 170 MPH, EF4 intensity, as it entered the western city limits of Newnan. One home at the end of Fairview Drive had all exterior and interior walls removed. Four homes along Arlington Court north of Lagrange St were destroyed with one having all exterior and interior walls removed, but leaving a vehicle nearly untouched in what was the garage.

As the tornado moved east of Boone Drive, it directly struck Newnan High School and the surrounding athletics fields causing broken windows and doors and extensive roof and structural damage. A portion of the second-story brick wall near the front of the main campus building collapsed. One man died after he suffered a heart attack while trying to reach his daughter's home in a heavily damaged neighborhood after the storm had passed and first responders were unable to reach him due to the large amounts of debris in the area. The tornado weaken from this point onward continuing into the southern part of downtown Newnan, passing directly over the county Justice Center and adjacent administrative building which houses the 911 facility. Extensive roof and window damage along with some interior wind and water damage occurred at the facility. Numerous homes continued to receive damage from winds and falling trees as the tornado moved east-northeast crossing E Broad Street and Greison Trail with 120 to 135 MPH wind speeds. The tornado weakened further as it crossed I-85, causing only minor damage to trees and businesses on the southern end of the Ashley Park shopping center and a hospital. The tornado did re-intensify near the Windsong and White Oak neighborhoods around Shenandoah Boulevard and White Oak Drive east of the Newnan city limits, with max winds of 120 MPH. The tornado continued east-northeast weakening again but still producing damage to trees and power lines, some falling on homes as it crossed Sullivan Road and Lora Smith Road before passing over the Thomas Crossroads area. In neighborhoods south of Andrew Baily Road and north of Highway 34, several homes received damage from falling trees. The tornado continued weakening with more sporadic damage to several trees as it continued east-northeast crossing Fisher Road and Minix Road and moving into Fayette County. [3/25/21: Tornado #2, County #2/3, EF-4, Heard, Coweta, Fayette, 2021:007].

03/25/21 22:55 EST	0.40M	Tornado (EF1, L: 2.76 mi , W: 200 yd)			
03/25/21 23:00 EST	0	Source: NWS Storm Survey			

A National Weather Service survey found that an EF1 tornado with maximum wind speeds of 95 MPH and a maximum path width of 200 yards touched down as it crossed Highway 41 on the north side of Cartersville uprooting some pine trees and toppling a few onto power lines. The storm moved northeast crossing Oakridge Drive and uprooting trees onto homes. The tornado reached its maximum intensity as it crossed onto Greenacre Lane and Ridgedale Road where numerous trees were snapped or uprooted onto and around homes. Several homes also had shingles blown off or portions of their roof peeled back. The tornado continued to the northeast crossing Grassdale Road and moving along Old Grassdale Road where the windows and doors at a gas station were blown out and portions of a wall were blown down. Numerous trees were snapped or uprooted onto or near homes in this area as well. The tornado struck a large metal warehouse peeling large portions of the metal roof and throwing the panels hundreds of yards to the northeast of the building. The tornado continued northeast crossing Peeples Valley Road snapping and uprooting trees on both sides of the road before moving into a largely wooded area and lifting before reaching I-75. [3/25/21: Tornado #3, County #1/1, EF-1, Bartow, 2021:008].

A National Weather Service survey determined that an EF0 tornado with maximum wind speeds 75 MPH and a maximum path width of 800 yards occurred in Fayette County. The Heard-Coweta County tornado moved east-northeast into Fayette County and northern Peachtree City crossing Line Creek east of Minix Road. It snapped a few trees near MacDuff Parkway where new homes were being constructed. Portable restrooms and light construction materials were also blown around. A few trees were downed on the CSX railroad tracks near Senoia Road and along Highway 74 near Kedron Drive. Large trees blocked the entrance to the Kedron Hills neighborhood at Loring Lane and Peachtree Parkway. The tornado finally ended near Astoria Lane at the northeast end of Kedron Hills in Peachtree City. [3/25/21: Tornado #2, County #3/3, EF-0, Heard, Coweta, Fayette, 2021:007].

A slow-moving upper low far northwest of Kauai generated heavy showers and thunderstorms over the isle. The rainfall caused flash flooding in the Hanalei area in the northern part of the island as the Hanalei River overflowed onto Kuhio Highway. Their were no reports of serious injuries. The costs of any damages were not available.

A winter storm brought a mix of precipitation and gusty winds to eastern lowa, northwest Illinois, and far northeast Missouri on Monday, March 15. Precipitation initially began as rain but changed to snow during the early morning hours of the 15th. The snow began to mix with sleet during the morning as cooler air moved into to the area aloft. Eventually, precipitation changed to all snow, and

Minor flooding occurred on the Mississippi River. Low-lying flood plain was underwater, which mostly consists of farmland.

03/25/21 15:00 CST

March brought a return to warmer weather with an active spring-like pattern. There were a couple rounds of heavier rain, somewhere within the Mississippi basin, regionally that contributed to additional river flooding. Monthly precipitation was above normal at most locations, as much as 150 to 200 percent above normal in the lower Missouri and mid Mississippi Valleys.

A cold front swept through the region on March 27th. The low level forcing along the front, increasing upper level ascent downstream of an approaching shortwave, and at least modest moisture and instability were sufficient to generate thunderstorms as the front moved through the region. There were numerous reports of large hail and damaging winds as well as one tornado.

	03/04/21 18:00 CST		15K	Flood (due to Heavy Rain)

Minor flooding occurred on the Ohio River. About a dozen county roads in the floodplain were flooded, and some were impassable. They were mostly county roads flooded near the river, outside the Evansville city limits. Most of the flooded roads were south of Interstate 69 in the southeast part of the county and in lowland areas in the southwest part of the county. Basements along the riverfront began to fill. Backwater flooding of Pigeon Creek inundated low-lying fields and woodlands. The levee authority operated several pumping stations and closed the flood gates downtown.

Heavy rain on February 28th sent the mainstem rivers above flood stage early in March. Minor flooding occurred on the Ohio, Wabash, and White Rivers. The generally 1 to 2 inches of rain that fell on the 11th caused the river falls to come to an end, but it was not enough

ANSAS, North Central
KS-Z005) PHILLIPS
03/01/21 00:00 CST 0 Drought
03/16/21 00:00 CST 0

3.00 inches in most places, with the first one producing amounts as high as 4-5" in parts of primarily Phillips/Rooks counties. As a result, cumulative monthly totals of 3.50-6.00" were common across the area...or generally 200-400 percent of normal. This very abundant March rain was more than enough to prompt one to two category drought improvements area-wide, effectively slamming the door on any lingering issues. By month's end, roughly 95 percent of the six-county area was completely void of all drought categories (including D0), with only part of northwestern Phillips County still hanging on to D0. On an additional positive note, despite the markedly-wet month there was a pronounced lack of flooding within North Central Kansas (both river and areal), owing to a nearly ideal combination of factors: predominantly light to moderate rain rates falling onto unfrozen ground and thus easily infiltrating dry soils. Per around fifteen NWS cooperative observers, a few of the highest March rain totals featured: 7.06" in Phillipsburg, 5.74" four miles west-northwest of Plainville and 5.71" at Smith Center. Sites on the slightly lower end of the spectrum (but still well above normal) were: Beloit (4.20"), Cawker City 4.93" and Covert (4.94").

(KS-Z005) PHILLIPS, (KS-Z006) SMITH, (KS-Z007) JEWELL, (KS-Z017) ROOKS, (KS-Z0	18) OSBORNE, (KS-Z	019) MITCHELL
03/29/21 20:00 CST	0	High Wind (MAX 54 kt)
03/29/21 23:00 CST	0	

A strong cold front brought a blast of strong to severe wind gusts during the evening of March 29th. Dangerous fire weather conditions developed during the afternoon of March 29th and prompted the issuance of a Red Flag Warning as strong southerly wind gusts increased (generally 30 to 40 mph) and relative humidity decreased out ahead of a strong cold front moving in from the northern High Plains. The cold front moved into north central Kansas in the 8 p.m. to 11 p.m. time frame. Strong surface pressure rises on the order of 5-7 mb per two hours helped to mix down strong north to northwest wind gusts of 50 to 60 mph immediately along and behind the cold front. The strongest gusts were most concentrated from around Smith and Phillips Counties and areas further west and southwest. The strongest wind gust in north central Kansas from this event was 62 mph, measured by a mesonet station north of Bellaire in Smith County. No significant or unusual impacts beyond what is typical for strong winds in the area were reported from this event, and luckily, no major fires were sparked either before or after the cold front passage.

Across the street, a one-story family residence sustained roof and shingle damage with one of the front windows blown out.

Debris from the garage and one-story family residence was thrown up to a quarter-mile eastward into the forest. There were a couple of snapped and uprooted trees in the forest, but the most impressive damage was just beyond the small wooded area where a very noticeable ground grinding swirl could be seen across the farmers field. It measured approximately 40 yards wide, which was seen very clearly from a NWS aerial drone.

There were no signs of any damage beyond the farmers field, where the swirls ended abruptly.

house also sustained some minor roof, siding, and gutter damage.

A bow echo moving at over 50 mph produced sporadic straight-line wind damage with a distinct tornadic path, primarily along Slack Rd in the Roanoke community. The tornado touched down about a half mile west of 1598 Carter Brothers Road. Aerial photography from a NOAA NWS drone shows distinct swirls along several farmers' properties with damage to a half dozen barns and numerous uprooted and snapped trees. Cedar trees were the most common tree that sustained damage during this tornado.

At 1598 Carter Brothers Rd, a riding lawn mower was thrown about 50 yards and a garbage can flew 150 yards. There were snapped, twisted, and uprooted trees facing in nearly every direction. Winds at this location were between 90 and 95 miles an hour.

There were indications that this was an intermittent skipping tornado. Along Dan Dunn Road several barns sustained significant roof and sidewall damage, and a 50 foot by 50 foot chain link fence was bent at 90 degrees along every support post.

The most significant damage of the tornado path was found at 3000 Slack Rd. It destroyed two barns and did significant roof and siding damage to a well-built one-story residential home. Insulation and metal siding were thrown in multiple directions. At the end of the property, aerial drone photography showed trees going in nearly every direction. Wind speeds in this location were estimated to be 100 mph. Residents at the house said they could feel the intense pressure and everything trying to suck out of the house.

On the way to the next storm damage survey we found sporadic straight line wind damage in Hardin County. This included three mobile homes that sustained roof damage near the Hardin County Fairgrounds.

SCOTT COUNTY 0.6 N GEORGETOWN [38.21, -84.55]

There was a large tree down across Warrendale Avenue.

Early in the day, low level wind shear was very strong. A stable layer over the area allowed a warm front to bring sunshine and warmer temperatures to the region, but the warming surface temperatures caused the stable layer to erode and become unstable. The high shear environment allowed storms, ahead of a cold front, to become severe and severe hail, damaging winds, and three tornadoes resulted.

Dispatch reported a road being impassable in the McHargue community.

A warm front lifted north into the state Saturday, allowing for an intensification of moisture advection into the area. This was then followed up by a passing cold front and associated cold front, both of which provided lift and helped provide heavy rains across the state. While instability was limited, there was some severe thunderstorms which produced hail during the morning hours of Saturday, March 27th. The main story, however, was the flooding that occurred after the rounds of heavy rain Saturday night into Sunday.

The Little Sandy River at Grayson rose above its 21 foot flood stage on the last day of February. On March 1st the river crested at 27.95 feet, tentatively the fifth highest crest of all time at this location, then returned to its banks the next day on the 2nd. Extensive property damage occurred in the town of Grayson while the river was out of its banks and backwater along streams and creeks drained into the Little Sandy. Many of the local roadways became unusable as flood water spilled into the town and up toward the I-64 corridor.

Tygarts Creek near Greenup rose above its 20 foot bankfull level on the afternoon of March 1st. The creek crested at 20.35 feet and returned to its banks late that same evening. Low areas along State Route 7 and County Route 2070 flooded during this time. The country store in Load and some homes near Tygarts Creek also flooded.

In the town of Ashland, the Ohio River rose above its 52 foot flood stage on the second day of March. The river crested at 58 feet on March 3rd and would gradually return to its banks a few days later on the 5th. Backwater caused flooding to occur along Route 3 down into Catlettsburg and surrounding areas of Ashland outside of the flood wall.

	03/26/21 09:00 EST		0	Source: Coast Guard

A compact closed low passed just to the northwest of the area. Accompanying this system, a strong and well-mixed low-level jet advanced just to the east of Lake Erie. This was an unusual system since it originated in the southern branch of the jet stream and was already a closed mid-level low. This did not fit the pattern of what typically causes strong winds in our area, but it certainly did cause very strong winds with lots of damage and numerous measured gusts over 60 mph. There seemed to be a favorable environment for funneling along the Chautauqua Ridge and across the Niagara Frontier, as those were the locations with the strongest large scale wind gusts. Ahead of the cold front, early morning convection affect the Lake Erie shoreline as well as the Buffalo area, convection redeveloped in the afternoon over the North Country with discrete cells resulting in concentrated damage in Lewis County.

Power lines were blown down in La	VSW SHELBURN [32.86, -91.31] 03/16/21 16:06 CST		ЗK	Hail (1.00 in)

Quarter size hail fell along Highway 2. A motorist noted some dents in their car from the hail.

A stalled front, combined with a warm and moist airmass, led to the development of showers and thunderstorms across the region. With high atmospheric moisture present, flash flooding occurred across portions of south and central Mississippi. As daytime heating occurred, storms were able to become severe. This resulted in damaging winds and large hail.

Location	Date/Time	Deaths &	Property &	Event Type and Details
		Injuries	Crop Dmg	
An EF1 tornado with estimated maximum winds near	ar 105 mph touched down in th	e North Desoto E	states subdivision	in Stonewall, where two homes
sustained moderate roof damage. The tornado cont	tinued northeast while crossing	l Highway 171 jus	t north of the North	Desoto Elementary/Middle/High
School campus, where it crossed Ann Francis Drive	e. At this location, an attached	garage of a home	was completely de	estroyed after the tornadic winds

compromised the garage door, removed the roof, and caused the collapse of the exterior brick walls, which were lightly mortared to the foundation. The roof was lifted nearly 30 feet into the air and thrown over a set of trees and into a field to the northeast. The remainder of the home was left relatively undamaged. The tornado continued east-northeast over open country snapping and uprooting numerous trees. It turned more to the northeast after crossing Interstate 49 and produced more consistent tree damage along Rodeo Drive just north of Stonewall-Frierson Road. Roofing was also peeled back from a small outbuilding at the north end of Rodeo Drive. The tornado continued to track northeast across a heavily wooded area before crossing the extreme southeast sections of Wallace Lake into extreme Southeast Caddo Parish.

CADDO COUNTY 1.9 ESE NORTON [32.32, -93.67], 1.9 W GAYLES [32.33, -93.66]

03/27/21 19:41 CST	0	Source: NWS Storm Survey					

This is a continuation of the Northern Desoto Parish tornado. This EF1 tornado, which had weakened slightly with estimated maximum winds near 90 mph, tracked across the extreme southeast sections of Wallace Lake over Wallace Lake Dam where additional hardwood and softwood trees were snapped and uprooted, with minor roof damage occurring to a home along Ellerbe Road. The tornado lifted in a pecan orchard shortly after crossing Ellerbe Road.

03/27/21 22:17 CST	0	Hail (0.75 in)			
03/27/21 22:17 CST	0	Source: Public			

Penny size hail fell just southwest of the Eastwood community. Report from mPING.

BOSSIER COUNTY 0.1 ENE HAUGHTON [32.53, -93.50]					
03/27/21 22:31 CST	0	Hail (1.00 in)			
03/27/21 22:31 CST	0	Source: Public			

Quarter and slightly larger size hail fell in Haughton.

A longwave trough shifted east out of the Rockies and into the Central and Southern Plains during the day on March 27th, with the southwest flow ahead of the trough ejecting a series of upper level disturbances northeast across Northeast Texas, Southwest Arkansas, and Northwest Louisiana during the afternoon and evening. Meanwhile, a broad warm and moist sector had spread north across all of the Ark-La-Tex into Eastern Oklahoma and much of Arkansas ahead of this trough, with temperatures warming into the upper 70s and lower 80s areawide. This resulted in moderate instability developing as large scale forcing increased during the late afternoon through the evening hours, resulting in scattered to numerous shower and thunderstorm development across much of these areas. Increasing wind shear late in the afternoon also promoted the development of scattered severe thunderstorms over East Texas, Southwest Arkansas, and Northwest Louisiana, with various reports of damaging winds and large hail received. However, one lone supercell developed over Eastern Anderson County Texas, which produced multiple tornadoes along its track across East Texas, before eventually moving into Northern Desoto and Southeast Caddo Parishes in Northwest Louisiana. These storms eventually organized along a broken line as it pushed into North Louisiana, ahead of a cold front that shifted southeast into the area through the early morning hours of the 28th.

UNION COUNTY 4.5 ENE FARMERVILLE ARPT [32.75, -92.26], 5.5 SSW LINVILLE [32.76, -92.25]						
03/30/21 19:54 CST	30K	Tornado (EF1, L: 1.18 mi , W: 105 yd)				
03/30/21 19:56 CST	0	Source: NWS Storm Survey				

An EF1 tornado with estimated maximum winds near 105 mph touched down near the intersection of Highway 2 and Les Parker Road near the Nolan Place subdivision. A small metal outbuilding was destroyed and large branches were broken while sporadic trees were snapped and uprooted. As the tornado continued northeast toward Joe Kennedy Road, it widened and intensified, snapping numerous hardwood and softwood trees along its path. The tornado caused minor shingle damage to one single family home along Joe Kennedy Road, while also snapping and uprooting trees before lifting along a hunting road north of Joe Kennedy Road.

A warm front lifted north across North Louisiana and into Southern Arkansas during the afternoon and evening of March 30th, ahead of an upper trough and associated cold front that ejected through the Southern Plains and into the Lower Mississippi Valley. Moderate instability developed at the surface and aloft near this warm front, with large scale forcing ahead of the trough/cold front contributing to the development of scattered showers and a few thunderstorms over Southcentral Arkansas and portions of Northcentral Louisiana. Ample deep layer shear and enough directional shear near the warm front contributed to an isolated supercell thunderstorm

Outflow from storms downed trees and wires in portions of Queen Anne's County along MD-213 north of Centreville and south of Church Hill. Time estimated from radar.

KENT COUNTY 0.8 NNE GOLTS [39.34, -75.77]			
	03/28/21 17:46 EST	0	Thunderstorm Wind (EG 50 kt)
	03/28/21 17:46 EST	0	Source: Utility Company

Trees and wires were downed near Golts Caldwell Rd. Time estimated from radar.

As strengthening low pressure tracked through the Great Lakes on March 28, a strong cold front approached the mid-Atlantic coast. A narrow ribbon of modest instability developed ahead of the front. With strong wind fields in place and strong forcing from the cold front, a line of convection developed. The minimal instability caused this to be a low-topped convective line with little, though not zero, lightning. However, the strong forcing and wind fields caused the line to become a fairly prolific producer of straight line wind damage. A number of severe wind gusts were measured, with numerous reports of tree, utility, and some structural damage.

A cold front passed through southern New England on the evening of March 28th. The next morning, on the 29th, a strong upper level short wave trough moved through New England, with a reinforcing shot of cold air. Strong to damaging westerly winds generally gusted to 50 to 60 mph during the morning and early afternoon hours.

#### MASSACHUSETTS, West (MA-Z001) NORTHERN BERKSHIRE 03/01/21 13:00 EST 0 High Wind (MAX 52 kt) 03/02/21 13:00 EST 0 (MA-Z025) SOUTHERN BERKSHIRE 03/01/21 13:00 EST 7.50K Strong Wind (MAX 40 kt) 03/02/21 13:00 EST 3K (MA-Z001) NORTHERN BERKSHIRE 03/02/21 03:00 EST 0 Cold/Wind Chill 03/02/21 10:00 EST 0

A strong cold front moved across the region on Monday, March 1 advecting in a much colder air mass along with a prolonged period of strong to locally damaging winds which continued into the early part of Tuesday, March 2. Wind gusts between 40 and 60 mph were common across the region, which led to some downed trees and power lines and isolated power outages.

Colder air continued to filter into the region during the overnight and early morning hours of March 2 with low temperatures mainly in the single digits. This, combined with continued gusty winds, led to wind chill values falling to between 15 and 22 degrees below zero in some areas.

#### Key impacts: tree damage, power outages.

A strong cold front pushed across the region during the evening hours on Sunday, March 28 which resulted in a period of high winds into the afternoon hours on Monday, March 29. Wind gusts were generally in the 35 to 50 mph range, but a peak wind gust of 58 mph was recorded at the Pittsfield Municipal Airport. Trees were reported down across the region. One of these trees fell onto a vehicle, but the individual in the vehicle was not injured.

More than 3,000 people were without power as a result of the wind event.

Key Impacts: tree damage, power outages.

An early Spring storm caused a few severe storms to develop across portions of southern Minnesota during the afternoon of Wednesday, March 10th.

A cold front moved southward across southern Minnesota before stalling from south-central Minnesota, northeast to the southeast part of the Twin Cities metro area by Wednesday morning. Behind the front, temperatures fell and held in the 30s and 40s all day. Along and ahead of this front, temperatures rose into the 50s and 60s with sunshine developing in the afternoon. Wind shear values were quite high as a 50-80 knot 500 hPa jet moved overhead. At the surface, a strong low-pressure system moved from north-central lowa, north-northeastward along this frontal boundary. Scattered thunderstorms developed in the afternoon in the warm sector of the storm system. Some rotation was noted as the storms propagated northeast. However, most of the reports were rotating wall clouds vs. funnel clouds or tornadoes. There was a report of large hail near Waterville as this storm moved across the area. The strongest storm moved across Dakota County and produced several reports of large hail; the largest was 2.5 inches in diameter which fell near Inver Grove Heights. Almost all of the reports came from social media pictures and relayed to the NWS.

By the early evening, most of the storms weakened and moved off into west-central Wisconsin.

(MN-Z041) DOUGLAS, (MN-Z042) TODD, (MN-Z047) STEVENS			
03/10/21 17:00 CST	0	Winter Storm

An early Spring storm caused a variety of weather across central and southern Minnesota during the afternoon and evening of Wednesday, March 10th.

A cold front moved southward across Minnesota before stalling from south-central Minnesota, northeast to the southeast part of the Twin Cities metro area by Wednesday morning. Well behind this front, temperatures fell and held in the 30s and 40s all day.

During the morning and early afternoon, light precipitation developed across west-central and central Minnesota. Reports of rain, sleet, and snow were noted in ASOS/AWOS observations. More widespread and continuous precipitation developed in the late afternoon with light to moderate snowfall around the Alexandria area. The snowfall continued into the evening before ending after midnight.

There were several reports of snowfall amounts between 4 and 8 inches across northern Stevens, northern Douglas, and northern Todd Counties. The heaviest, with isolated reports higher then 8 inches, was across northern Todd County.

During the evening of Sunday, March 14th, a very large storm system began to move out into the plains with a broad circulation across most of the Northern Plains/Upper Midwest. The surface low was centered across Kansas with several weaker shortwaves moving around the broad circulation through Monday night, March 15th. Initially, very dry air below 15,000 feet was noted from Sunday evening and Monday morning soundings at the Chanhassen NWS. This kept most of the precipitation from reaching the ground until the atmosphere started to saturate from the continuous feed of mid-level moisture.

Surface observations at Fairmont, Minnesota reported light precipitation around 1 AM CST. This area of precipitation slowly spread northward during the morning, reaching Redwood Falls, New Ulm, Mankato, and Waseca around 330 AM CST. The precipitation didn't reach the southwest metro area until 9-10 AM CST as the dry easterly flow continued.

As the system began to pivot and the deeper moisture moved northward, the precipitation ended in portions of southwest Minnesota. However, one continuous feed of mid-level moisture across southeast Minnesota, and into south-central Minnesota kept a steady area of moderate to heavy snowfall. This area of heavier precipitation was able to move as far north as the southern Twin Cities metro area during the mid-late afternoon. However, most of the forcing with this system was weakening and the precipitation started to end. By the early evening, the steadier snowfall had ended with some lingering light snow across east-central and central Minnesota.

The heavier snowfall occurred in a 25-50 mile band from New Ulm, southeast and east toward Mankato, Waseca, and Owatonna. The

tion Date/Time Deaths & Property & Event Type and Details Injuries Crop Dmg
est was reported around Mankato where there were a couple of reports of 10 to 11 inches in a 12 hour period. Another 10 to 11 report was near Nicollet, Minnesota.

A large slow-moving area of low pressure wandered from Colorado to eastern South Dakota over a two-day period. Precipitation circulated back into northwest lowa and southwest Minnesota, which started as a period of rainfall prior to evening on March 14. Rain mixed and changed to snow during the late evening and early overnight. Snow became heavy at times during overnight, with snowfall rates up to 2 inches per hour.

COVINGTON COUNTY --- 2.9 WSW LUX [31.44, -89.45], 0.6 ENE SANFORD [31.48, -89.42]

Location	Date/Time	Deaths & Injuries	Property & Crop Dmg	Event Type and Details
	03/30/21 17:04 CST		5K	Tornado (EF0, L: 3.55 mi , W: 150 yd)
	03/30/21 17:14 CST		0	Source: NWS Storm Survey

An EF-0 tornado began along Lott Town Road where it snapped a softwood tree limb. It continued to track northeast across US Highway 49, snapping or uprooting a few softwood trees. As the tornado continued northeast across Walter Lott Road, several tree limbs were broken. It snapped large tree limbs and uprooted a few trees along Okatoma River Road and Old Highway 49. The tornado dissipated at McConnel Foster Road. Estimated peak wind gust was 75 mph. The tornado was also captured in a video shared by local broadcast media.

# Showers developed during the afternoon and evening of March 30th near a lingering frontal boundary. One shower was able to develop a tornado in the Pine Belt.

A cold front pushed into a moist and unstable airmass resulting in numerous showers and thunderstorms across West Tennesee and North Mississippi during the early morning hours of March 31st. Heavy rainfall resulted in flash flooding while a few severe storms produced damaging winds and a couple of weak tornado across Northeast Mississippi. **MISSISSIPPI, South** WILKINSON COUNTY --- 3.7 WNW WILKINSON [31.23, -91.31], 3.7 WNW WILKINSON [31.24, -91.31] 03/17/21 16:06 CST 0 Tornado (EF0, L: 0.84 mi , W: 100 yd) 03/17/21 16:07 CST 0 Source: NWS Storm Survey A one mile long, 100 yard wide, ef0 tornado with max winds of 85 mph touched down just west of highway 61 north in Wilkinson county, MS. The tornado was recorded crossing the highway by a storm chaser. Survey results from the emergency manager noted two main areas of tree damage, along the highway and off carter loop road. In the afternoon hours on March 17th, 2021 a potent negatively tilted shortwave trough axis aided in ample downstream divergence to support strengthening low-level surface cyclogenesis across Arkansas. Ahead of this system, ample unstable air accompanied a large portion of the northern Gulf coast, combined with approaching and intensifying low-level shear to produce organized severe thunderstorms across the northern portions of southeastern Louisiana and southwestern Mississippi. Tree fell on a mobile home from	thunderstorm winds. One fatality was reported	d from a resident ir	side the home at t	he time.
Direct Fatalities: F62MH				

During the daytime hours on March 23rd through March 24th, a deep west coast trough helped to deliver progressive yet strong southwesterly upper-level to mid-level moist flow across the northern Gulf coast. At the surface, a complex of strong to severe thunderstorms approached the area from the west, quickly advancing east causing widespread severe thunderstorms and areas of flash flooding. Another round of thunderstorms developed during the day on March 24th.

MISSISSIPPI, Southeast		
WAYNE COUNTY 6.2 SW WHISTLER [31.65, -88.91], 3.5 W HIWANNEE [31.79, -88.76]		
03/17/21 11:03 CST	0	Tornado (EF2, L: 13.10 mi , W: 325 yd)
03/17/21 11:22 CST	0	Source: NWS Storm Survey

The tornado first touched down just west of Pleasant Grove Strengthford Road. The tornado continued northeast and quickly strengthened as it moved across Overstreet and Braze Overstreet Drive. At Braze Overstreet Drive, the tornado is estimated to have reached EF-2 intensity based on the significant and complete damage to a large area of pine trees. The tornado persisted on a northeast track and reached peak intensity as it destroyed several large, newer chicken houses on Jim West Road just east of Strengthford Cooley Road. The tornado crossed Highway 84 and conitnued northeast, lifting near Waller Ridge Road and Mabry Graham Road. Between Highway 84 and the lifting point, EF-1 intensity damage was noted to primarily trees. A mobile home on Beat 4 Shubuta Road suffered roof damage.

WAYNE COUNTY 3.5 NE DENHAM [31.68, -88.49], 5.2 NE DENHAM [31.70, -88.46]					
03/17/21 14:44 CST	0	Tornado (EF1, L: 1.63 mi , W: 400 yd)			
03/17/21 14:47 CST	0	Source: NWS Storm Survey			

The tornado started on Sunlight Church Road in Wayne County, MS just west of the Choctaw County line. The tornado moved into extreme southwest Choctaw County and produced high end EF-1 intensity damage on CR 2 where several chicken houses were heavily damaged and numerous softwood and hardwood trees were downed or snapped. The tornado lost intensity as it headed northeast toward Silas, but still produced pockets of EF-1 damage especially in the Silas area, near Silas Branch. The tornado continued northeast and produced spotty, mainly light tree damage north of Highway 84 and toward Womack Hill. However, the tornado quickly strengthened and widened as it approached the Tombigbee River and crossed into northwest Clarke County. The tornado produced significant and extensive damage to large swaths of trees from the Trotter Road area right along the river, northeast to Campbell's landing road and to near the Marengo County line. Based on aerial footage of the extensive tree damage, the tornado was given an EF-2 intensity rating. A few river camp houses suffered roof damage. An older home on Campbell's Landing Road was heavily damaged and two people in the home suffered minor injuries. Adjacent modular homes suffered minor damage. It is possible that the path width of the tornado was greater than 400 yards, but additional analysis is needed.

A strong cold front moved through the southeast states, triggering a severe weather outbreak that produced several tornadoes along with numerous reports of large hail and damaging winds.

STONE COUNTY WIGGINS [30.85, -89.13], 1.0 NE WIGGINS [30.86, -89.12], 1	.2 ENE WIGGINS [30.85, -89.11], 0.6 ESE WIGGINS [30.85, -89.12	]
03/24/21 21:30 CST	0 Flash Flood (due to Heavy F	Rain)

ocation	Date/Time	Deaths & Injuries	Property & Crop Dmg	Event Type and Details	
A cold front swept through the region on March 27th. The low level forcing along the front, increasing upper level ascent downstream of an approaching shortwave, and at least modest moisture and instability were sufficient to generate thunderstorms as the front moved through the region. There were numerous reports of large hail and damaging winds as well as one tornado.

An anomalously deep Pacific trough initially brought H700 (mountain top) westerly winds of 50 to 80 kts on Sunday March 28th, 2021, which eclipsed the 99th percentile of climatology over many areas during the height of the storm. A tight surface pressure gradient, mountain wave activity, along with a well mixed atmospheric profile all contributed to transferring the elevated winds to ground level. Minimum relative humidity values fell into the 15 to 25 percent range as high temperatures warmed into the 60s to near 70 degrees. These conditions increased the risk for grassland fires and contributed to the explosive growth of the Greenhouse wildfire. On the backside of the storm, a cold front provided cold air advection and pressure rises for another round of strong winds Sunday night into Monday. Robust H700 cold air advection 60+ kt winds were also instrumental for the strong surface winds and snow shower

03/28/21 10:00 MST

development for that time period.

A powerful storm system brought Blizzard conditions to Sheridan County and winter storm conditions to Cherry County. Northeast winds of 25 to 35 mph with gusts to around 40 mph combined with moderate to heavy snowfall to produce blizzard conditions across Sheridan County. These blizzard conditions began during the late morning hours and continued during the afternoon hours into the early evening hours on March 14th. Snowfall amounts ranged from 6 to 10 inches across the northern half of Sheridan County with significant blowing and drifting and near zero visibility a times. All roads across Sheridan County were closed. Across Cherry County, east northeast winds of 20 to 35 mph combined with moderate to heavy snowfall to produce winter storm conditions. These conditions began during the afternoon hours and continued into the overnight hours March 14th. Snowfall amounts ranged from 6 to 11 inches across the northern half of Cherry County with significant blowing and drifting and visibility as low as a quarter mile at times. Most roads across Cherry County were closed.

Emergency management reported flooding due to an ice jam in low lying areas near South Ridge Road at Ridgeland Avenue and Big Island Road.

03/05/21 09:00 CST

This was the 2nd flood warning issued for the Fremont area associated with an ongoing ice jam. The first was in January. The ice jam persisted but significantly flooding wasn't significant in the interim. Flood Advisories were used to cover most of February. On February 25, emergency management reported Emergency management reported an ice breakup moving down the Loup River and into the Platte. Minor flooding was still occurring at South Ridge Road at Ridgeland Avenue.

Social media report and photo of a landspout tornado. The landspout was spotted on the east side of Trenton Dam and dissipated near the southwest edge of Trenton. The tornado lasted for four to five minutes. Key impacts: tornado.

During the afternoon hours of March 14th, showers and thunderstorms developed in a line across southwest Nebraska. This resulted in a brief landspout tornado near Trenton Dam.

During the overnight hours damaging winds accompanied a shower moving north over Red Willow County. These winds destroyed a three sided shed and blew some shingles off a house and garage nearby.

A strong cold front moved into far Southwest Nebraska during the early evening. Behind the front wind gusts up to 60 MPH were reported. The high winds caused blowing dust that reduced the visibility down to 5 miles.

### NEBRASKA, South Central

(NE-Z060) DAWSON, (NE-Z061) BUFFALO, (NE-Z072) GOSPER, (NE-Z073) PHELPS, (NE-	Z082) FURNAS, (N	IE-Z083) HARLAN
03/01/21 00:00 CST	0	Drought
03/23/21 00:00 CST	0	

Although drought conditions across most of South Central Nebraska had already eased a bit in recent weeks after peaking in intensity between Oct. 2020-Jan. 2021, copious March rainfall was just what the doctor ordered to either completely eradicate or at least greatly improve the drought situation area-wide. In fact, the majority of long-time NWS cooperative observer and airport stations notched a Top-2 wettest March on record, either eclipsing or falling slightly short of existing monthly marks mainly from 1987 (more on that below).

The month opened with at least portions of the following six western counties assigned either Severe (D2) or Extreme (D3) Drought by the U.S. Drought Monitor: Furnas, Gosper, Phelps, Dawson, Buffalo and Harlan (the majority of D3 concentrated in Furnas/Gosper). Thus March marked the eighth-consecutive month with at least D2 assigned to some portion of South Central Nebraska (since D2 was first introduced to portions of Kearney/Adams counties in Aug. 2020). Outside the aforementioned six worst-off counties, the remainder of the 24-county area began March in a mix of Moderate Drought (D1) and Abnormally Dry (D0). These categories held firm through the first, dry few weeks of the month. However, things changed big-time between the 13th-23rd as two weather systems each dumped widespread soaking rains. The first of these systems (centered on the 13th-14th) was the "main event" with amounts commonly 2-6 inches. The second system (mainly the 22nd-23rd) tacked on an additional 1-3", prompting impressive (and in several cases record-breaking) monthly totals of 4-9"...or generally 200-500 percent of normal. Unfortunately, the higher-end monthly tallies of 6+" largely targeted counties along/east of the Highway 281 corridor instead of the overall-driest far western counties. Nonetheless, the abundant March rain was more than enough to prompt one to three category drought improvements area-wide, effectively slamming the door on all but lower-end, lingering issues. By month's end, roughly 80 percent of the 24-county area was completely void of all drought categories (including D0). Meanwhile, the majority of the early-month D2-D3 in far western counties improved to a mix of D0-D1, with any D1 confined solely to western Gosper, southwestern Dawson and northwestern Furnas counties. On an additional positive note, despite the markedly-wet month there was a pronounced lack of flooding within South Central Nebraska (both river and areal), owing to a nearly ideal combination of factors: predominantly light to moderate rain rates falling onto unfrozen ground and thus easily infiltrating dry soils. Per several dozen NWS cooperative observers, a few of the highest March rain totals featured: 9.02" three miles north of York, 8.93" in Osceola and 8.65" at Central Nebraska Regional Airport (Grand Island). On the lower end of the spectrum (but still well above normal) were stations farther west such as: Gothenburg (4.14"), Ord airport (4.55") and Elwood 8S (4.75"). Along with various other long-term sites, all three official Tri Cities airport gauges washed away their former March records from 1987 with the following amounts: 8.65" at Grand Island, 8.16" in Hastings and 7.55" at Kearney.

#### (NE-Z060) DAWSON

03/04/21 12:30 CST	2K	Wildfire
03/04/21 16:00 CST	0	

Deepening low pressure across the central and southern High Plains led to strong southeasterly wind gusts and warm air advection during the afternoon of March 4th. Despite the southeasterly wind direction, which is usually a direction for moisture advection, the low to mid level air mass remained very dry. The dry low level air mass combined with warm temperatures to produce minimum relative humidity values around 20 percent, which when combined with southeasterly wind gusts up to 30 mph, led to dangerous fire weather conditions in the presence of dry fine fuels. These conditions supported the growth of a rather large wildfire in Dawson County, near Interstate 80. Other than a temporary closure of portions of Interstate 80, impacts were limited.

A strong cut-off and negatively tilted low pressure system brought widespread heavy rain and strong wind gusts to south central Nebraska on this day. An anomalously deep low pressure system slowly migrated from the Four Corners region on March 13 to the Central Rockies on March 14. Strong/deep southerly low to mid level flow brought copious amounts of moisture from the Gulf of Mexico, leading to precipitable water values near the climatological max for mid March. The deep moisture advection, combined with slow moving nature of the upper trough led to the development of widespread showers and weak thunderstorms during the day of March 13 that persisted well into the daytime hours of March 14. Luckily the area had been warm and relatively dry after a very cold and snowy February, which had this not occurred prior to this event, there very well could've been a repeat of the historical March 2019 flooding. Also fortunate for the area was that instability remained weak throughout the 13th and 14th, which helped to limit the rainfall rates and avoid a more significant hydrological event despite the widespread 2 to 7 inches of rain! Both Grand Island and Hastings broke back to back daily rainfall records on the 13th and 14th, respectively. In addition to the daily records, Grand Island also broke records for most precipitation in a calendar day and for the overall March total! So needless to say, this was a very significant rainfall event for the area, let alone for mid-March. Despite the significant rainfall, overall hydrological impacts were limited, owing to the aforementioned limited rain rates.

Another aspect of this system was the strong winds. The depth of the surface low was not particularly deep, only around 1000 mb, but the pressure gradient was still impressive due to a strong area of surface high pressure in southern Canada. This resulted in a nearly 20 mb gradient from southwest to northeast across the state of Nebraska. Peak wind gusts from this event were near 60 mph, centered in the area between the KS/NE state line and Highway 92 and occurred from around sunrise through around noon. Thereafter, winds slowly subsided as the pressure gradient gradually relaxed. Impacts from the wind ranged from minor tree damage to a damaged car port.

Marginally severe thunderstorms developed across portions of south central Nebraska during the evening hours of March 26th...the first severe storms of the 2021 convective season. A weak disturbance in active southwesterly upper flow combined with strong low level warm air advection, steep mid level lapse rates (7.5-8.5 C/km), moderate effective shear (30-40kt), and modest instability (MUCAPE near 500 J/kg) to produce scattered low-topped thunderstorms between 7 p.m. and 10 p.m., some of which became marginally severe. The main impact was nickel to quarter size hail, but even these instances were fairly isolated and short-lived. Thunderstorms weakened after 10 p.m. and remained non-severe through the remainder of the overnight hours.

A strong cold front brought a blast of strong to severe wind gusts during the evening of March 29th. Dangerous fire weather conditions developed during the afternoon of March 29th and prompted the issuance of a Red Flag Warning as strong southerly wind gusts increased (generally 30 to 40 mph) and relative humidity decreased out ahead of a strong cold front moving in from the northern High Plains. The cold front moved into northwest portions of the area between 7 p.m. and 9 p.m., then cleared southeast portions of the area around midnight. Strong surface pressure rises on the order of 4-7 mb per two hours helped to mix down strong north to northwest wind gusts of 50 to 60 mph immediately along and behind the cold front. The strongest gusts were most concentrated from around the Tri Cities to the south and west. A gust of 66 mph was the strongest gust recorded during the event and was measured by a mesonet station near Riverdale in Buffalo County. No significant or unusual impacts beyond what is typical for the area were reported from this event, and luckily, no major fires were sparked either before or after the cold front passage.

was investigated for indications of a possible tornado, but it was determined all damage was consistent with straight line winds. Time estimated from radar.

As strengthening low pressure tracked through the Great Lakes on March 28, a strong cold front approached the mid-Atlantic coast. A narrow ribbon of modest instability developed ahead of the front. With strong wind fields in place and strong forcing from the cold front, a line of convection developed. The minimal instability caused this to be a low-topped convective line with little, though not zero, lightning. However, the strong forcing and wind fields caused the line to become a fairly prolific producer of straight line wind damage. A number of severe wind gusts were measured, with numerous reports of tree, utility, and some structural damage.

An active pattern over New Mexico continued over March 16-17, 2021 as another strong winter storm system impacted the state. As the low pressure system and its associated cold front tracked eastward across New Mexico, westerly winds strengthened across much of the area. Due to a potent upper-level jet, the strongest winds were observed across eastern and southern New Mexico. Areas of snow also increased across northern New Mexico with mountain locations receiving about 5 to 8 inches of snow. The biggest impacts were felt across the northeast corner of the state where the combination of snow and strong winds resulted in blizzard conditions. These blizzard conditions resulted in severe driving conditions and the closure of U.S. Highway 64 from Raton to Clayton.

About 4 inches of snow was reported by a trained spotter in Clayton on the morning of March 17, 2021. Photo courtesy of Marianne Rose.

CHAVES COUNTY 0.9 SW ROSWELL [33.37, -104.53]					
03/22/21 11:55 MST	0	Hail (0.75 in)			
03/22/21 12:05 MST	0	Source: Public			

A strong thunderstorm near Roswell produced brief hail with the largest hailstones estimated to be about 0.75".

A low pressure system tracking across northern New Mexico resulted in snow across portions of northern New Mexico as well as thunderstorms across the eastern plains on March 22, 2021. Snow amounts were generally light with this system with the highest accumulations across the northern Sangre de Cristo mountains and its east slopes where 3 to 6 inches was reported. Lower elevations along the adjacent highlands reported about 1 to 4 inches of snow through the 22nd. Enough low-level moisture and instability resulted in a few thunderstorms across the east central and southeast plains. A stronger thunderstorm near Roswell produced brief penny size hail.

A strong and cold low pressure system deepened over the Great Basin area before tracking eastward over the state of New Mexico starting on March 23 and continuing through March 24, 2021. Meanwhile, a potent cold front surged south and west through eastern New Mexico, and upslope flow associated with this front helped to set the stage for heavy snow across the east slopes of the central mountain chain. The highest snow accumulations were observed across the northern mountains and along the east slopes where 12 to 24 inches was received. This led to snow-packed and icy roads across much of northern and central New Mexico, and travel was heavily impacted. A major accident involving 39 vehicles along Interstate 40 east of Moriarty led to several injuries as well as the closure of the busy travel corridor. Meanwhile, as the cold front was channeled through the central mountain chain, very strong gap winds were observed in the Albuquerque area. The Albuquerque Sunport measured a peak wind gust of 68 mph which resulted in numerous reports of downed trees and power outages across the city.

A large tree was downed at Spain and Juan Tabo in northeast Albuquerque during the early morning hours of March 24, 2021. Photo courtesy of Mark Ronchetti.

03/02/21 03:00 EST	0	Cold/Wind Chill
03/02/21 10:00 EST	0	

A strong cold front moved across the region on Monday, March 1 advecting in a much colder air mass along with a prolonged period of strong to locally damaging winds which continued into the early part of Tuesday, March 2. Wind gusts between 40 and 60 mph were common across the region, which led to reports of downed trees and power lines, resulting in scattered power outages. The more concentrated areas without power included around the Capital District and into Ulster County in the mid-Hudson Valley.

As colder air moved into the region, a few snow showers and squalls passed across the region during the evening hours of March 1. At the Albany International Airport, visibility dropped to one quarter of a mile with a peak wind gust of 46 mph within a snow squall, which lasted for about 17 minutes.

Colder air continued to filter into the region during the overnight and early morning hours of March 2 with low temperatures mainly in the single digits and teens, but below zero in the typical colder spots in the higher elevations. This, combined with continued gusty winds, led to wind chill values falling to between 15 and 24 degrees below zero in some areas.

Key Impacts: tree damage, power outages, road closures, transportation delays.

A passing cold front brought a period of strong winds to the region spanning the evening hours on Friday, March 12 into the early morning hours on Saturday, March 13. Wind gusts reached 45 to 55 mph in some areas. Some downed trees and wires occurred as a result of the wind. One tree fell onto two unoccupied vehicles in Saugerties, causing extensive damage.

Key Impacts: tree damage, damage to vehicles.

An EF-1 tornado tracked across portions of northern Orange County, with an estimated maximum wind gusts of around 100 miles per hour. The storm initially produced straight line wind damage across eastern Alamance County before producing more widespread tornado damage in Orange County a few minutes later. The tornado snapped off and downed numerous trees and power lines along the path, along with blowing a roof off a house near Pentecost Road.

A mid level trough approached central North Carolina from the west and moved across the area during the afternoon and evening. This helped spark a round of late day showers and thunderstorms, some of which produced severe weather across the central Piedmont along a cold air damming surface boundary. Several tornadic storms occurred along and north of Interstate 85 during the late afternoon hours along the aforementioned boundary.

--------------------------------------	------------------------	------------------------

A deep low pressure system moved along the Canadian border as a strong cold front swept through North Dakota. This led to strong winds developing over western and central North Dakota including the James River Valley. Additionally, the mixing of stronger winds aloft down to the surface was occasionally aided by light rain and snow showers moving through, enhancing wind gusts. The strongest reported wind gust of 72 mph occurred in Divide County.

### NORTH DAKOTA, East

A cold front swept through the Northern Plains from late Monday, March 29th, into Tuesday morning, March 30th. Strong winds developed from the south on Monday with gusts into the 40 to 45 mph range, and switched from the northwest and peaked with the overnight frontal passage at from 55 to near 70 mph across portions pf northeast and east-central ND.

Strengthening low pressure tracked across the Great Lakes and into the northeast CONUS on March 26th. With the surface low track and low-level jet positioning both favorable, strong wind gusts were able to develop in the deep mixing behind a cold front. Numerous surface wind gusts in the 40 to 60 MPH range were recorded from the predawn hours into the early afternoon.

Across eastern Ohio, numerous reports of tree and wire damage were received, with downed trees impacting traffic in some locations. No major incidents of structural damage were noted, although a large sign was blown down in New Philadelphia.

OHIO, North CUYAHOGA COUNTY --- PARMA [41.40, -81.72] 03/26/21 03:13 EST 0 Thunderstorm Wind (MG 50 kt) 03/26/21 03:13 EST 0 Source: Trained Spotter A spotter's anemometer recorded a peak gust of 58 mph when a rain shower was overhead. A potent surface low moved northeastward along a stationary front from northeast Indiana to far-southern Quebec during the wee hours through early afternoon of March 26th. Simultaneously, the trailing cold front swept eastward from near the Indiana/Ohio line to near Lake Champlain and northern Chesapeake Bay. A tight surface pressure gradient accompanying the low and rapid surface pressure rises behind the cold front contributed to damaging wind gusts across northern Ohio.

The Ohio River at Ironton rose above its 52 foot bankfull level on March 3rd and would not return to its banks until two days later on the 5th. The river at this location crested at 54.10 feet. During the time the Ohio River was out of its banks, low areas along Storms Creek in Ohio flooded.

Periods of rain that occurred from Friday February 26th through the morning of Monday March 1st due to multiple disturbances caused flooding to occur across southeast Ohio. Over two inches of rain fell in the area, which spilled into the Ohio River and led to moderate river flooding for the first few days of the new calendar month. The Ohio River at Lloyd Greenup Lock reached a historic crest height of 57.99 feet, which is the 8th highest crest this location of the river has ever observed.

	03/18/21 16:40 EST		Source: Social Media	

Low pressure crossed through the region on March 18th accompanied by a cold front at the surface. Peaks of sunshine during the late morning and early afternoon allowed the atmosphere to become unstable and develop severe thunderstorms as the frontal boundary trekked through the state. Large hail of up to 1.5 inches was observed in Gallia County that afternoon within two different thunderstorms that passed overhead.

03/26/21 05:15 EST	5K	Strong Wind (MAX 49 kt)
03/26/21 05:15 EST	0	

A low pressure system impacted the region during the afternoon on March 25th and exited during the early morning hours of March 26th. Although a few strong storms and rainfall of slightly half an inch were associated with it, the biggest impact was due to the high winds as the associated cold front passed through southeast Ohio. Wind gusts of 35-60 mph were reported in parts of the area, with a 60 mph gust being reported north of Stockport, Ohio in Morgan County. In Perry County, strong winds behind the frontal passage caused trees to be blown over onto power lines north of New Lexington.

The Neosho River near Commerce rose above its flood stage of 15 feet at 5:30 am CDT on March 18th. The river crested at 18.97 feet at 4:15 pm CDT on the 19th, resulting in moderate flooding. Low-lying areas around Miami were flooded, including Riverview Park. The river fell below flood stage at 2:00 am CDT on the 22nd.

The presence of a frontal boundary, a persistent flow of unseasonably moist air from the Gulf of Mexico, and the slow approach of an upper level system to the Southern Plains, resulted in multiple rounds of showers and thunderstorms across northeastern Oklahoma from the 12th through the 17th. Four to eight inches of rain fell along and north of a line from Pawhuska to Grove during the period, with up to ten inches occurring locally. This widespread heavy rainfall resulted in moderate flooding on portions of the Caney River, Bird Creek, and the Neosho River.

Thunderstorms developed along a warm front over northwestern Oklahoma during the evening of the 16th. These storms developed eastward along the front, into northeastern Oklahoma during the early morning hours of the 17th. The strongest storms produced large hail up to quarter size, and wind gusts to 60 mph. Another round of thunderstorms developed across eastern Oklahoma during the afternoon of the 17th, as a cold front moved into the area. The strongest storms produced hail up to quarter size.

Unseasonably warm temperatures and strong, gusty wind, combined with very low humidity and dormant, dry fine fuels to promote conditions that supported the rapid spread of wildfire across eastern Oklahoma during late March. A number of wildfires occurred across the region during this period, but the largest fires affected Creek County where over 3200 acres were burned, Cherokee County where over 650 acres were burned, and Latimer County where over 450 acres were burned.

#### **OKLAHOMA**, Panhandle

(OK-Z003) BEAVER			
	03/01/21 00:00 CST	0	Drought
	03/31/21 23:59 CST	0	

During the month of March, the southwest Texas Panhandle and areas south and west on the High Plains continued to slip deeper into drought. Soil moisture was a big concern going through the month as farmers had to start planning for the planting season. The long duration of drought thus far in some of the areas around the combined Panhandles had created concern even for irrigated fields, as well water has been declining greatly. Not to mention the very little hope of planting in fields not irrigated where soil moisture has been poor to non-existent. A few storms and even a late season snow storm brought some moisture to the area. The northern parts of Randall County in Texas and Cimarron county in Oklahoma saw some improvements from these events.

(OK-Z002) TEXAS		
03/01/21 14:34 CST		Vildfire
03/01/21 18:00 CST	0	

A ongoing moderate drought along with 40 mph or higher winds, and low relative humidity values combined to contribute to a high fire danger day. A large wildfire over the northwest portion of Texas County in the Oklahoma Panhandle burned in a very short time.

(OK-Z002) TEXAS		
03/04/21 15:21 CST	0	Wildfire
03/04/21 23:00 CST	0	

Gusty southerly winds in the afternoon which then shifted to the northwest and north behind a cold front during the evening and remained strong and gusty, along with low relative humidity values near 20 percent, and extremely dry conditions all contributed to an increased fire threat in the central Oklahoma Panhandle.

A very potent upper level system produced widespread hazards from heavy snow across the front range/Rockies to severe weather across the Southern High Plains. In the Texas Panhandle, eight confirmed tornadoes occurred and the northern edge of the severe thunderstorms with this event impacted portions of the Oklahoma Panhandle.

	03/17/21 03:00 CST	0	Winter Storm	
	03/17/21 17:00 CST	0		

A dynamic storm system brought high winds and a heavy wet snow on the 17th of March 2021. This combination led to blizzard conditions in some areas and near blizzard conditions in others. Travel was impacted area wide and isolated power outages were reported. Some areas got well above 6 inches of snow with drifts of one to two feet. The day prior this same system produced severe thunderstorms capable of one inch diameter hail and wind gusts well over 60 mph in the eastern Texas Panhandle.

Strong Wind (MAX 35 kt)

#### Direct Fatalities: M??UT

Gusty west winds following a cold frontal passage knocked down a single tree from a steep embankment across the 3800 block of Lisburn Road in Cumberland County. The tree brought down power lines and struck a truck that was traveling southbound on Lisburn Road. There were two occupants in the truck, one of whom was killed by the falling tree.

Storm Data and Unusual Weather Phonomena - March 2021

A severe thunderstorm producing winds estimated near 75 mph caused a partial collapse of a barn and roof damage to another barn at 278 Millwood Road in Salisbury Township. One minor injury was reported.

A sharp cold front crossed the area during the afternoon of March 28, 2021, generating a solid line of gusty showers over western Pennsylvania that very gradually intensified as it progressed eastward across the commonwealth and eventually produced isolated thunder. This line eventually produced some wind damage, knocking down a barn in far eastern Lancaster County near Gap.

Partial collapse of a barn near Gap, PA.

Downed tree limbs and wires were reported near Canterberry Ct. Time estimated from radar.

As strengthening low pressure tracked through the Great Lakes on March 28, a strong cold front approached the mid-Atlantic coast. A narrow ribbon of modest instability developed ahead of the front. With strong wind fields in place and strong forcing from the cold front, a line of convection developed. The minimal instability caused this to be a low-topped convective line with little, though not zero, lightning. However, the strong forcing and wind fields caused the line to become a fairly prolific producer of straight line wind damage. A number of severe wind gusts were measured, with numerous reports of tree, utility, and some structural damage.

### PENNSYLVANIA, Northeast

(PA-Z044) LACKAWANNA			
	03/26/21 12:43 EST	0	High Wind (MAX 50 kt)

03/26/21 09:39 EST	0	High Wind (MAX 50 kt)
03/26/21 09:56 EST	0	

A potent surface low moved northeastward along a stationary front from northeast Indiana to far-southern Quebec during the wee hours through early afternoon of March 26th. Simultaneously, the trailing cold front swept eastward from near the Indiana/Ohio line to near Lake Champlain and northern Chesapeake Bay. A tight surface pressure gradient accompanying the low and rapid surface pressure rises behind the cold front contributed to damaging wind gusts in northwest Pennsylvania.

#### PENNSYLVANIA, West

(PA-Z007) MERCER, (PA-Z013) LAWRENCE, (PA-Z016) JEFFERSON, (PA-Z020) BEAVER, (PA-Z021) ALLEGHENY, (PA-Z073) WESTMORELAND, (PA-Z074) WESTMORELAND RIDGES, (PA-Z076) FAYETTE RIDGES 03/26/21 02:00 EST 0.53M High Wind (MAX 50 kt) 03/26/21 13:00 EST 7K

Strengthening low pressure tracked across the Great Lakes and into the northeast CONUS on March 26th. With the surface low track and low-level jet positioning both favorable, strong wind gusts were able to develop in the deep mixing behind a cold front. Numerous surface wind gusts in the 40 to 60 MPH range were recorded from the predawn hours into the early afternoon.

Widespread reports of tree and wire damage were received from southwest Pennsylvania. A few incidents of structural damage were noted, chiefly in Beaver and Allegheny Counties. West Penn Power reported over 17,000 customers without power at one point during the morning, with Duquesne Light seeing 6,767 outages.

Avenida Martinez Nadal was intransitable in the lane from SJU to Guaynabo. Also, the intersection of Road 19 with Ave Luis Vigoreaux was intransitable as well with several cars submerged.

A surge of low-level moisture along with east-southeast flow generated a line of persistent showers that affected the San Juan metro area.

Time estimated.

Sufficient atmospheric instability and strong wind fields contributed to some of the storms producing strong straight-line wind gusts and some wind damage.

Thunderstorm winds blew down several trees, including this one onto a home, in the town of Wagener in NE Aiken Co SC. Photo courtesy Aiken Co Emergency Management.

(SD-Z045) JONES				
	03/29/21 13:00 CST		0	Wildfire
	03/29/21 20:00 CST		0	

A fire ignited about 6 miles northwest of Okaton in Jones County during the afternoon on March 29th. Critical fire weather conditions were in place across the region given the very low relative humidity and strong winds. Though the fire initially spread east-northeast due to westerly winds, a passing cold front shifted winds to the northwest and thus the fire's propagation to the southeast. A dramatic increase in winds with gusts to around 60 mph during this time led to the development of a large, wind-driven fire which eventually reached and passed over Interstate-90. The interstate was closed from 3 to 6 pm as a result. A total of around 9,500 acres of grassland were burned, per the Great Plains Fire Information Center. Over 100 customers lost power during the fire and high winds.

Tree and power lines were blown down on Hawthorne Hill Road.

A potent weather system on March 25, 2021 led to an outbreak of supercells and tornadoes across Mississippi, Alabama, Georgia, and Tennessee, some of which were strong to violent. Across Middle Tennessee, a left-moving or anticyclonic supercell caused dozens of reports of large hail and wind damage from the Nashville metro northward to the Kentucky border during the afternoon. Later in the evening, additional supercell thunderstorms developed and spawned three tornadoes in Wayne, Lewis, Lawrence, and Rutherford Counties, as well as more reports of hail and wind damage.

A man drowned in his vehicle after driving around high water barricades into flood waters on Tennessee Waltz Parkway near Highway 12 in Ashland City.

#### Direct Fatalities: M65VE

An historic flash flooding event affected the central third of Middle Tennessee from the early morning hours on March 27 through the day into the early morning hours on March 28. A warm front moved northward into Middle Tennessee early on March 27 before stalling near the I-40 corridor. Between 300-400 AM CDT, numerous showers and thunderstorms developed along the warm front, many of which became severe and produced large hail up to half dollar size along with frequent lightning and heavy rainfall. Showers and storms continued off and on the rest of the day across Middle Tennessee, particularly near the stalled warm front. In fact, another round of severe thunderstorms including supercells developed during the afternoon and evening hours near and south of the warm front. These storms dropped large hail up to tennis ball size and caused a few reports of wind damage, but the main impact was additional heavy rainfall which began causing flash flooding south of Nashville. Flooding only worsened as showers and storms redeveloped over the same areas through the evening, with numerous Flash Flood Warnings issued and several reports of flooded roads and water rescues.

After midnight, even more heavy rainfall falling along the already waterlogged I-40 corridor prompted a rare Flash Flood Emergency for the southern and eastern Nashville metro area, including southeastern Davidson County, western Wilson County, and northern Williamson County. These areas received between 7" to 9" of rain, causing rapid rises on several Nashville metro creeks and streams, including Sevenmile Creek (which reached its highest level on record), Browns Creek, and Mill Creek, among others. Many of these creeks reached within their 2nd or 3rd highest water levels on record. The rapid water rises flooded hundreds of homes and businesses, with reports of some people trapped in the attics or on the roofs of their houses. Dozens of roadways were flooded and impassable, including both I-24 and I-40, with many cars submerged in the flood waters and people forced to cling onto trees to avoid getting swept away. Although the flood waters receded quickly on Sunday, March 28, many area rivers reached flood stage in the week after the event, including the Cumberland River, Harpeth River, and Duck River.

A total of 7 deaths were reported from the flooding across Middle Tennessee, with 5 in Davidson County, 1 in Cheatham County, and 1 in Maury County. Emergency management reports indicate over 500 homes and businesses were flooded, and a Presidential Disaster Proclamation was declared for many counties in May 2021. This flash flood event was the worst seen in Middle Tennessee since the May 1-2, 2010 flood.

A slow-moving warm front lifted north into the Mid-South during the morning hours of March 17th with numerous showers and thunderstorms. Heavy rain produced some flash flooding and there were a couple of severe weather reports along with a couple of damaging lightning strikes. The front stalled across the area during the day with southern parts of the Mid-South, especially northeast Mississippi, becoming quite unstable during the afternoon hours. Additional storms developed during the late afternoon and evening as a cold front pushed into the region resulting in numerous severe storms, including a few tornadoes, across Northeast Mississippi along with flash flooding across the Memphis and Jonesboro areas.

Golf ball to baseball size hail was rep	orted near South Llano State Park.			
KIMBLE COUNTY 0.7 N JUNCTIO	N [30.4999.77]			
	03/24/21 21:38 CST		0	Hail (1.75 in)
	03/24/21 21:40 CST		0	Source: Public
The public reported golf ball size hail	in Junction.			
KIMBLE COUNTY 0.7 N SEGOVIA	a [30.43, -99.67]			
	03/24/21 21:49 CST		0	Hail (1.50 in)

A photo of hail estimated to be 1.5 inches in diameter at Segovia was received from social media.

A dryline out ahead of an approaching upper level low pressure system approached the area from the west. As the dryline interacted with a destabilizing airmass and plenty of shear, isolated severe thunderstorms formed and produced mainly large hail on March 22. A dust storm also developed and impacted the area from Sweetwater south to Water Valley with visibilities below 250 yards at times.

On March 24, the same upper level low pressure system caused another disturbance to track across the area along with the dryline. As these systems interacted with an unstable and highly sheared storm environment, severe storms erupted across the Northwest Hill Country. One of these supercell thunderstorms produced a very large hail from golf ball to baseball size near Junction. Two funnel clouds were reported near Roosevelt.

#### TEXAS, Central Southeast

producing bail and a couple of EE Unknown torn	adaaa Larga bail un ta tha ai	to of 2" was range	orted in Terrent on	d Donton counties

producing hail and a couple of EF-Unknown tornadoes. Large hail up to the size of 3" was reported in Tarrant and Denton counties. Hail-producing storms continued overnight as a cold front made its way through the area.

## TEXAS, North Panhandle

# (TX-Z016) DEAF SMITH, (TX-Z017) RANDALL COUNTY, (TX-Z018) ARMSTRONG 03/01/21 00:00 CST 0 03/31/21 23:59 CST 0

During the month of March, the southwest Texas Panhandle and areas south and west on the High Plains continued to slip deeper into drought. Soil moisture was a big concern going through the month as farmers had to start planning for the planting season. The long duration of drought thus far in some of the areas around the combined Panhandles had created concern even for irrigated fields, as well water has been declining greatly. Not to mention the very little hope of planting in fields not irrigated where soil moisture has been poor to non-existent. A few storms and even a late season snow storm brought some moisture to the area. The northern parts of Randall County in Texas and Cimarron county in Oklahoma saw some improvements from these events. However, the far southwest Texas Panhandle missed out on a lot of the moisture.

	r.			

A strong upper level low pressure system accompanied by a strong surface low provided some lift and instability across the eastern Texas Panhandle on the evening of the 16th. Several storms were able to produce severe hail up to 1.5 inches in diameter along with measured wind gusts up to 60 mph. Based on some damage in Ochiltree County during the late evening one storm put off a very strong outflow which is estimated to be around 80 to 85 mph winds toppling 18 train cars amongst downed powerlines and overturned semis. This same system eventually moved off to the east a bit bringing strong winds behind a cold front and snow the very next day.

An EF2 tornado with estimated maximum winds near 125 mph touched down again from the same supercell thunderstorm that produced the tornado near and over Lake Murvaul in Southwest Panola County, with this tornado downing and uprooting about 10 hardwood and softwood trees along Highway 59 several miles south of Carthage. The tornado intensified as it tracked parallel to FM 2517 and ripped the roof off of a single family home. The tornado's damage path widened considerably as it moved between FM 2517 and County Road 405. Security footage from a local meat processing center in the Antioch community indicates that a multiple-vortex tornado developed as the storm continued and produced a wide swath of snapped trees north and south of FM 2517.

Along County Road 405, the multiple-vortex tornado continued to completely destroy 3 metal outbuildings and shift another single family home off of its foundation. At this same location, the tornado tossed an antique vehicle 50 yards and wrapped sheet metal around approximately 10 trees. The tornado continued to snap large softwood trees along County Road 407, and as it crossed FM 699, it caused major roof damage to a brick home near the intersection of County Road 407 and County Road 408. A single-wide manufactured home utilizing a pan anchorage system was pulled free from the anchors and destroyed, with some of the debris blown a couple of hundred yards into a field to the east.

Hundreds of trees were downed in an area along County Road 448. As the tornado crossed FM 31, a large outbuilding was destroyed, but portions of the wooden frame were anchored by bolts to the foundation and remained in place. In this same area, a large pine tree was uprooted and fell onto a single-wide manufactured home, killing a 46 year old woman with her husband suffering a head injury. Another tree fell onto a vehicle nearby and injured two additional people. The tornado continued northeast snapping and uprooting additional trees and it travelled north of FM 2517. It crossed County Road 470, County Road 471, and finally lifted just east of County Road 332.

#### Direct Fatalities: F46MH

A longwave trough shifted east out of the Rockies and into the Central and Southern Plains during the day on March 27th, with the southwest flow ahead of the trough ejecting a series of upper level disturbances northeast across Northeast Texas, Southwest Arkansas, and Northwest Louisiana during the afternoon and evening. Meanwhile, a broad warm and moist sector had spread north across all of the Ark-La-Tex into Eastern Oklahoma and much of Arkansas ahead of this trough, with temperatures warming into the upper 70s and lower 80s areawide. This resulted in moderate instability developing as large scale forcing increased during the late afternoon through the evening hours, resulting in scattered to numerous shower and thunderstorm development across much of these areas. Increasing wind shear late in the afternoon also promoted the development of scattered severe thunderstorms over East Texas, Southwest Arkansas, and Northwest Louisiana, with various reports of damaging winds and large hail received. However, one lone supercell developed over Eastern Anderson County Texas, which produced multiple tornadoes along its track from Cherokee County northeast into Northwest Nacogdoches, Southern Rusk, and Southern Panola Counties, before eventually moving into Northern Desoto and Southeast Caddo Parishes in Northwest Louisiana. These storms eventually organized along a broken line as it pushed into North Louisiana, ahead of a cold front that shifted southeast into the area during the early morning hours of the 28th.

This is all that remains of a mobile home, truck, and metal outbuildings after an EF2 tornado tore through the Antioch community just south of Carthage in South-central Panola County during the evening of March 27th, 2021. Photo courtesy of WFO-Shreveport, LA.

A National Weather Service damage survey of the Bertram area found wind damage was caused by strong microburst winds. In particular, building damage in Bertram occurred along Hwy 29 between FM 243 and North East St. There was roof damage at several businesses as well as roof and wall failures of 2 buildings near the Highway 29

and North Grange St. intersection. Debris was blown generally west to east with

estimated winds at 75 mph. The damage was highly concentrated in this area of Bertram with no direct evidence of a tornado. Flying debris caused additional damage including broken windows at the Bertram library. As the severe thunderstorm moved east along Highway 29, additional roof damage was observed near Reed Circle.

east along highway 29, additional foor damage was observed hear filed Circle.

03/31/21 22:59 CST	0	

Some areas saw improvement in drought conditions through the month of March while other areas continued to see exceptional drought (D4) conditions. The central and eastern South Plains as well as the western Rolling Plains and extreme south-central Texas Panhandle saw drought conditions improve. The western South Plains and extreme southwestern Texas Panhandle continued to see very little rainfall through the month of March and no improvement. A few significant precipitation events occurred in March along with severe weather on the 12th, 13th, and 22nd. These events generally brought between one and two inches of rainfall over a widespread area. This greatly improved soil moisture levels where it did rain. However, topsoil moisture levels were still very low in the western South Plains into the extreme southwestern Texas Panhandle.

A Texas Tech University West Texas mesonet site near McAdoo measured a wind gust to 61 mph.

An intense upper level low slowly moving east near the four corners region Saturday afternoon resulted in an outbreak of tornadic thunderstorms across the Panhandle and South Plains of West Texas. An upper level jet streak rotating around the upper low enhanced large scale lift across the region by the afternoon hours. Surface cyclogenesis in the Texas Panhandle drew the surface warm sector northward. Initial thunderstorm development occurred along a dryline located roughly along the US Highway 385 corridor. Storms quickly became severe as they moved into a very unstable airmass characterized by mixed layer CAPEs of 1500-2000 J/kg. Very strong effective layer shear and low level helicities were conducive to produce tornadic supercells. A NWS storm survey reviewed three tornado paths from the 13th. The largest and longest duration tornado developed to the west-southwest of the town of Happy (Swisher County) and had a maximum damage rating of EF-1. This tornado extended well into the Texas Panhandle where it caused EF-2 damaged as determined by a survey by the NWS Weather Forecast Office in Amarillo. Another tornado north of Hart passed near a Texas Tech University West Texas mesonet recording a wind gust to 87 mph. A total of eight tornados were observed this day with three given EF ratings. The remaining five tornadoes were given ratings of EF-Unknown due to no survey being conducted and no reports of damage.

Photograph of a snapped off power pole west of Happy near the intersection of County Road C and County Road 3. Photograph taken by an NWS storm survey team.

	03/22/21 18:44 CST		0	Tornado (EFU, L: 0.01 mi , W: 20 yd)
	03/22/21 18:44 CST		0	Source: Trained Spotter

A trained spotter recorded a video of a brief tornado south of Paducah along the leading edge of a thunderstorm.

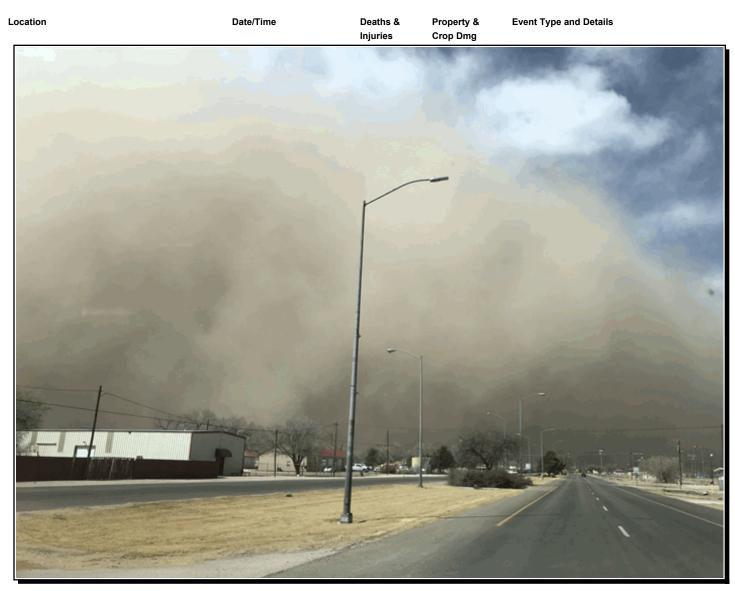

A strong upper level storm system brought both severe weather and a haboob with strong winds to the region. This storm system moved eastward over central New Mexico on the afternoon of the 22nd bringing very strong lift overhead. The lift encountered better moisture over the central South Plains bringing scattered showers and thunderstorms. Many locations received hail with the largest reported hail in Crosbyton (Crosby County) of quarter size. Scattered thunderstorms intensified into a line as they moved eastward during the afternoon hours also bringing severe wind gusts. Additional showers and thunderstorms developed underneath the center of the low in eastern New Mexico in the afternoon. Very dry surface air was present in eastern New Mexico which helped generate an intense outflow that raced from southeastern New Mexico across the southern South Plains and southern Rolling Plains. Wind gusts in excess of 70 mph lofted copious amounts of blowing dust and generated a haboob. The wall of dust dropped the visibility to near zero as it moved through.

High wind gusts from the Texas Tech University West Texas mesonet follow:

77 mph at Plains (Yoakum County),

- 76 mph at Slaton (Lubbock County), and Graham (Garza County),
- 74 mph at Sundown (Cochran County),
- 73 mph at Denver City (Yoakum County), and Brownfield (Terry County),
- 67 mph at Wolfforth (Lubbock County),
- 65 mph at Levelland (Hockley County),
- 61 mph at O'Donnell (Lynn County),
- 60 mph at Post (Garza County),

59 mph at New Home and Tahoka (Lynn County), and White River Lake (Crosby County).

A wall of dust (haboob) rolling through Hobbs, New Mexico on the afternoon of the 22nd. Photograph is courtesy of @BLD\_BTH on twitter.

03/01/21 08:00 EST	0	

An arctic front moved across Vermont during the evening of March 1st delivering arctic air on strong winds during the overnight of March 1st-2nd. Persistent northwest winds of 15 to 30 mph with gusts in excess of 40-50 mph began around 9 pm March 1st and continued until daybreak March 2nd. These strong winds combined with ambient temperatures of 5 below to 5 above zero created wind chills in the 15 to 30 below zero range. Nearly 10,000 customers lost power during the event.

Low pressure moved northeast across northern NY during the afternoon of March 26th. This was the same system responsible for the tornado outbreak across AL/MS/GA the previous day. Strong upper atmospheric winds (energy) combined with unseasonably mild and humid air accounted for a line of thunderstorms to develop just east of Lake Ontario and move ENE across the Adirondacks into the southern Champlain Valley of NY/VT and then into central VT.

Location	Date/Time	Deaths &	Property &	Event Type and Details
		Injuries	Crop Dmg	

One particular thunderstorm in this line caused scattered wind damage from northern Lewis and northern Hamilton counties into Essex county before moving across Addison county where an EF1 tornado occurred just north of Middlebury and this same storm caused scattered wind damage in Montpelier, East Montpelier, Plainfield and northern Barre.

Much of the damage was trees/limbs down along with utility lines but some structural damage to a "flimsy", temporary tin roof in Plainfield due to thunderstorm winds and some significant damage to a home and barn structures due to an EF1 tornado in northern Middlebury.

(VI-2013) BENNINGTON, (VI-2014) WESTERN WINDHAM, (VI-2015) EASTERN W 03/02/21 03:00 EST	0	Cold/Wind Chill	

A strong cold front moved across the region on Monday, March 1 advecting in a much colder air mass along with a prolonged period of strong to locally damaging winds which continued into the early part of Tuesday, March 2. Wind gusts between 40 and 60 mph were common across the region, which led to reports of downed trees and power lines along with some power outages.

Colder air continued to filter into the region during the overnight and early morning hours of March 2 with low temperatures mainly in the single digits to below zero. This, combined with continued gusty winds, led to wind chill values falling to between 15 and 25 degrees below zero in some areas.

Key Impacts: tree damage, power outages, transportation delays.

Multiple days of rainfall, which was heavy at times, produced saturated soils across much of Tazewell County, especially across the headwaters of the Clinch River. During the early morning hours of March 1st, the cold front moved southward from the Ohio River

A passing cold front produced strong winds in eastern Washington on March 28th. Winds reached gusts of 50-65 mph. These powerful winds produced blowing dust in the dry Columbia Basin and damage due to downed trees in much of far eastern Washington. Blowing dust had significant impact on travel creating poor visibility on major interstates and highways. The strongest winds and damage occurred in the late afternoon and early evening which created hazardous roadways for the evening commute.

Winds were strong enough to cause pow to a 7 car accident in Richland, WA.	y, March 28th pro /er outages in por	0 0 duced gusty winds tions of Kennewic	High Wind (MAX 73 kt)

A tornado occurred in Ilwaco, Washington just north of the Port of Ilwaco Airport. The tornado began near the intersection of Redwing Way and Captain Gray Drive around 1904PST, tracked northeast across a housing subdivision, crossed the Wallacut River before dissipating near the intersection of Chinook Valley Road and U.S. Highway 101 around 1908PST. The tornado track was about one-third of a mile long and 60 yards wide. There was minor damage to trees, fences, windows, shingles, and other unsecured attachments to structures along the path (DI 2, DOD 2).

After an active day of low topped supercells over the coastal waters, one moved ashore producing a tornado in Ilwaco, Washington during the evening.

The Greenbrier River at Alderson (ALDV2) crested at the moderate flood stage of 17.53 feet (52,600 cfs) at 8:15 pm EST on March 1st. This crest ranked between a 5- and 10-year average return interval per USGS StreamStats, and is the 11th highest crest for this gauge since 1960. Flooding within this stretch of the Greenbrier River caused Highway 3/12 to be covered by several feet of water and impassible at multiple locations downstream from the gauge between Alderson and Talcott. It did not appear much flooding occurred within the town of Alderson itself and no buildings were reported to be impacted. All damage was confined to the professional removal of fallen trees blocking stream channels within the area and other related repairs.

The Greenbrier River at Hilldale (HLLW2) crested at the minor flood stage of 21.38 feet (56,200 cfs) at 1:00 am EST on March 2nd. This crest ranked just under a 10-year average return interval per USGS StreamStats, and is the 9th highest crest for this gauge since 1936. Portions of Highway 12 were observed flooded within a quarter mile upstream from the gauge. Multiple homes along the right bank just downstream of the gauge were surrounded by water, but are elevated/on stilts. Flooded was limited to areas below the living space of these homes.

Multiple waves of low pressure passing along a cold front approaching from near the Ohio River resulted in several rounds of prolonged and, at times, heavy rain across northern and western portions of Greenbrier County. In the 72-hour period ending 7 am on March 1st, the northwestern half of the county had received between 2.5 to locally 4 inches of rainfall from shower and thunderstorm activity. Snow pack prior to the arrival of the rainfall was confined to the highest elevations of the western half of the county, where 2 to locally 4 inches was on the ground. Portions of Pocahontas County to the north, where the upstream reaches of the Greenbrier River are located, had up to 9 inches of snow pack. Nearly all remaining snow in both counties melted with this rainfall, contributing to the runoff entering the local rivers by the morning of the 1st, when widespread minor to moderate river flooding occurred. On March 3rd, Gov. Jim Justice included Greenbrier County among eighteen total West Virginia counties in a declared State of Emergency due of the flood damage. Heavy rain moved south during the early hours of the 1st, impacting Mercer County with more localized flooding that caused a road closure.

03/18/21 19:30 EST	0	Hail (1.00 in)	
03/18/21 19:30 EST	0	Source: Law Enforcement	

Hail accumulated on the ground such that it was several inches deep.

A low pressure system moving along a warm front lifting north into northern North Carolina, helped sparked isolated thunderstorms along and north of this boundary in Virginia and Southeast West Virginia. One of these storms turned severe, producing localized large hail in Monroe County.

The Clay Roane public service district experienced widespread flooding which caused the water plant to begin to fail. Technicians could not access the pumps due to the flooding and had to wait to refill their tanks until the waters receded. It would take until the 2nd before technicians could reach the tanks and repair these issues.

Both lanes of Procious Maysel Road were covered in high water with one lane becoming impassable. A water rescue was conducted on Hartland Road after a person drove their vehicle into high water.

Flooding occurred at multiple times during this event around Kanawha County. At midnight, Rocky Fork Road in Cross Lanes became impassable due to high water, East Dupont Avenue in Shrewsbury became flooded, and Kanawha Avenue in Clendenin also became impassable.

Around daybreak more impassable roads transpired due to flooding. These included US-119 and Spencer Road in Clendenin due to Little Sandy Creek rising out of its banks, and Dry Branch Road in Coal Fork. Several homes in the town of Chesapeake began to flood due to a blocked culvert.

In the afternoon on the 1st, additional rainfall contributed to continued flooding in the county. Several homes along James Drive near Sissonville flooded as Pocatalico Creek rose out of its banks. In Clendenin, a portion of 1st Avenue flooded due to the Elk River rising. The South Charleston Community Center was closed for several weeks after this event to clean up the facility after around 6 feet of water entered the building.

The town of Marlinton was evacuated due to the Greenbrier River rising above its banks and spilling into residential roadways and homes. This impacted residents along First Avenue through Fifth Avenue, as well as Eighth and Ninth Streets. Local citizens in Greenview also evacuated along the Spruce River as high water rose into their homes. Napps Creek also flooded between Marlinton and Huntersville. WV Route 39 was closed due to high water.

The Tug Fork River at Williamson rose above its 27 foot flood stage on morning of March 1st. The river crested at 39.40 feet just after midnight on the 2nd, and retreated below its flood stage later that evening. This became the 10th highest crest this gage has ever noted.

While above flood stage, the Tug Fork caused the South Williams flood gate to close on Highway 292 with sections of the interstate flooded. Several roads outside of Williamson and South Williamson became impassable due to high water. The flood gate at the South Williamson Flood Wall was also closed. The local water treatment plant was surrounded by water during this event and had to close down. Old Route 52 and other areas near the river outside of the flood wall became flooded. The railroad yard in Williamson was impacted by the deluge of water as well as Route 162 near Turkey Creek and other low lying areas adjacent to the river. The Harvey and Vinson Street water pumps were engaged to help mitigate flooding issues during the time the river was above its flood stage.

The Tug Fork River at Kermit rose above its 38 foot bankfull level on the morning of March 1st. The river crested at 46.71 feet the next morning on March 2nd and eventually returned to its banks just after midnight on the 3rd. This observed river crest is tentatively the third highest crest this gage has ever noted. Several businesses south of Virginia Street, Wayne Street, and Cabell Street were impacted. Flooding also occurred in the residential section of Kermit between the river and the railroad tracks.

#### Direct Fatalities: U??CH

Historic winter storm crippled much of southeast Wyoming with heavy wet snow followed by strong winds and blizzard conditions. Cheyenne received 22.7 inches of snowfall in 24 hours (storm total 30.8 inches) with 4 to 6 foot drifts developing all over. Highest snowfall amount reported over 70 inches (4.5 inches snow water equivalent) in the North Laramie Range. Most areas were digging out from the storm for at least the following week as snow plows got stuck on roadways. Received numerous reports of roof collapses due to the heavy, wet snow. Areas of southeast Wyoming also experienced thundersnow with the heavier snow bands early Sunday morning.

Tractors and heavy equipment continue to plow the Interstate 80 Summit around the clock to clear the 5+ foot drifts along the roadway. Photo courtesy of the Wyoming Department of Transportation.

Much of southeastern Wyoming experienced high winds on the 29th. Many sensors from area ASOSs to Wyoming Department of Transportation sensors measured high wind gusts in excess of 60 mph. Two sensors across the region measured 80 mph wind gusts during this event.
