	06/14/23 10:00 CST		0	Source: Public
BARBOUR COUNTY --- 2.8 SW EUFAULA [31.86, -85.19], 1.2 E EUFAULA [31.88, -85.13]				
	06/14/23 11:09 CST		0	Tornado (EF1, L: 3.89 mi , W: 350 yd)
	06/14/23 11:20 CST		0	Source: NWS Storm Survey
<p>National Weather Service meteorologists surveyed damage in far eastern Barbour County and determined that it was consistent with an EF 1 tornado, with maximum winds near 110 mph. The tornado touched down in a forested area between Sandy Lane west of Highway 30. The tornado quickly intensified and snapped or uprooted a number of large pine trees on the south side of Highway 30. The tornado crossed Highway 30 and uprooted another grove of pine trees and causing damage to a church. The tornado weakened slightly as it crossed US Highway 431, then rapidly intensified and caused the most significant tree damage along the path on the western banks of Barbour Creek, with snapped and uprooted trees, some of which caused major damage to a home. The tornado continued east-northeast and crossed Paul Lee Parkway and State Docks Road, where more trees were uprooted, the side of a metal building structure was removed, and three units of an apartment complex sustained partial roof damage. The tornado then caused another area of significant tree damage between Cypress Cove Drive and Inlet Road. The tornado weakened after moving over the waters of the Walter F George Reservoir and likely dissipated.</p>				
BLOUNT COUNTY --- HENDRIX [34.03, -86.45]				
	06/14/23 11:09 CST		0	Hail (1.00 in)

TUSCALOOSA COUNTY --- RALPH [33.05, -87.77]				
	06/16/23 17:49 CST		0	Thunderstorm Wind (EG 83 kt)
	06/16/23 17:50 CST		0	Source: NWS Storm Survey
A long-lived supercell thunderstorm produced widespread damage across far southwest Tuscaloosa County , mainly in the Ralph Community. Hundreds of tree were uprooted and snapped between Ralph and Interstate 20. In addition to the significant tree damage, numerous structures were also damaged, some heavily. Notably, several homes with varying degrees of roof and siding damage, including occasional partial roof loss, were observed around Sipsey Valley Road, Ralph Loop, Shepard Park Road, and Shadow Wood Road. The area from Ralph Loop and Sipsey Valley southeastward to Shadow Wood contained the most intense area of damage, with winds estimated up to 95 mph. Several homes sustained roof damage/loss, either from wind or trees.

CULLMAN COUNTY --- 1.5 ENE GOLD RIDGE [34.28, -86.73], 1.6 S COUNTY LINE [34.28, -86.70]				
	06/25/23 14:38 CST		0	Thunderstorm Wind (EG 61 kt)
	06/25/23 14:40 CST		0	Source: NWS Storm Survey
A localized damaging wind swath extended along County Road 1488 north of Fairview. The swath caused minor damage to the roof of chicken houses and then caused a few small tree limbs to snap before ending just before County Road 1527. While there were several mobile and manufactured homes in the swath, no thresholds of visible damage were noted by the survey team. Due to the sporadic nature of the damage and small limbs of trees impacted, there was not sufficient evidence to evaluate this as tornadic damage.				
DEKALB COUNTY --- 0.3 NNE SKIRUM [34.32, -85.97]				
	06/25/23 15:12 CST		2K	Thunderstorm Wind (EG 52 kt)
	06/25/23 15:12 CST		0	Source: Trained Spotter

HENRY COUNTY --- 1.0 SW GRABALL [31.57, -85.28], 1.1 NNE ABBEVILLE [31.58, -85.25]				
	06/14/23 09:40 CST		0.25M	Tornado (EF1, L: 2.14 mi , W: 160 yd)
	06/14/23 09:55 CST		0	Source: NWS Storm Survey
This tornado touched down in a wooded area west of U.S. Highway 431 and uprooted some trees. It then demolished half of a large out building right along the highway removing the roof and collapsing the walls. An adjacent small office building had substantial roof damage. The tornado then crossed Highway 431 and snapped several hardwood trees. As the tornado approached Singletary Road, it destroyed some outbuildings and removed substantial roofing material from two adjacent homes. One of the homes also had some siding removed and the porch was damaged. Several trees were also uprooted in this area. The tornado crossed the other end of a curving Singletary Road, snapping and uprooting more trees. Near the intersection of Singletary Road and W. Washington St., the tornado toppled several concrete memorial monuments. After crossing Washington St. The tornado toppled trees on Marianna Drive and Alberta Drive. Finally, the tornado snapped or uprooted several trees in the vicinity of a cemetery on East Washington St. before lifting short of Eufaula Highway. Damage along the entire path was estimated to be consistent with EF-1 damage with maximum sustained winds around 100 mph.

	06/15/23 11:11 CST		0	Flash Flood (due to Heavy Rain)
	06/15/23 12:45 CST		0	Source: Broadcast Media
Flash flooding was reported along County Road 28.				
<p>The middle part of June was unusually stormy across the area. Numerous rounds of strong to severe storms impacted the region with multiple squall lines that produced severe winds as well as supercells that produced large hail and tornadoes. Heavy rain also occurred over a multi-day period, which saturated the ground and led to some instances of flash flooding.</p> <p>The synoptic pattern featured well above average 250 mb zonal wind anomalies, which were traceable back to an active subtropical jet stream. Greater than average instability was also present, in part due to anomalously warm Gulf of Mexico SSTs. This combination of above average shear from the active subtropical jet and above average instability from the warmer than average SSTs provided a synoptic environment favorable for severe weather as upper level shortwaves moving through the area. This pattern persisted for many days, leading to an unusually large amount of severe weather.</p>

	06/19/23 05:35 CST		0	Thunderstorm Wind (EG 50 kt)
	06/19/23 05:35 CST		0	Source: 911 Call Center
Trees were blown down on Post Oak Road.				
<p>The middle part of June was unusually stormy across the area. Numerous rounds of strong to severe storms impacted the region with multiple squall lines that produced severe winds as well as supercells that produced large hail and tornadoes. Heavy rain also occurred over a multi-day period, which saturated the ground and led to some instances of flash flooding.</p> <p>The synoptic pattern featured well above average 250 mb zonal wind anomalies, which were traceable back to an active subtropical jet stream. Greater than average instability was also present, in part due to anomalously warm Gulf of Mexico SSTs. This combination of above average shear from the active subtropical jet and above average instability from the warmer than average SSTs provided a synoptic environment favorable for severe weather as upper level shortwaves moving through the area. This pattern persisted for many days, leading to an unusually large amount of severe weather.</p>

Storm Data and Unusual Weather Phenomena - June 2023

Location	Date/Time	Deaths & Injuries	Property & Crop Dmg	Event Type and Details
<p>An unusual anticyclonic tornado began just west of the Mobile River associated with the anticyclonic bookend vortex of a powerful Mesoscale Convective System moving across the area. The tornado likely began just west of the Mobile River based on a radar debris signature and continued to the southwest of Stockton near the Tensaw River. After completion of the storm survey, it was determined the tornado continued as an EF1 cutting across the Tensaw river where a narrow path of trees snapped exists. The tornado turned to the east moving across Live Oak Road snapping and uprooting multiple pines and oaks. Past this, a lack of convergent damage suggests the tornado likely lifted somewhere on Live Oak Road prior to reaching State Highway 225. Additional intense straight line wind damage was surveyed near the path associated with the bookends RFD just to the north where straight line wind speed estimates were upwards of 90mph.</p>				
<hr/>

Strong thunderstorms tracked across the area and became severe in a very moist and unstable airmass. The thunderstorms produced damaging winds, large hail and a couple of weak tornadoes.				
MOBILE COUNTY --- 0.9 SW IRVINGTON [30.49, -88.24], 2.7 SSE THEODORE IDLE HOUR A [30.55, -88.25]				
	06/16/23 23:21 CST		0	Tornado (EF0, L: 3.91 mi , W: 80 yd)
	06/16/23 23:28 CST		0	Source: NWS Storm Survey
<p>NWS Storm Survey found a weak EF-0 tornado associated with a QLCS near Irvington. The tornado began just south of Old Pascagoula Rd where a couple large hardwood limbs were snapped and very weak convergence was noted through this area. A wider swath of damaging wind likely extended west where small branches were snapped laying due south. The tornado then crossed I10 where it produced minor damage to the undershirt to two manufactured homes. The tornado continued down McDonald road where a more noticeable concentration of hardwood tree damage was noted near Roush Rd. A few hardwoods were snapped but the trees appear to be rotted and un-healthy leading to a lower bound estimate more in line with large branches. Weak convergence was noted in the damage with a more divergence pattern further west towards the Walmart Facility where likely 60-75 mph straight line winds occurred. The tornado was likely discontinuous or intermittent as it traveled south/southeast towards Half Mile Rd where it produced minor tree damage in the form of small to medium limbs being snapped. A farm outbuilding had a section blow out near Half Mile Rd and Matlock Rd. An opening on the one side of the building suggests a lower bound estimate for this damage as wind likely got inside the building unimpeded. The metal from this building was deposited almost due east of the bar suggesting convergence along or near Matlock Rd. The tornado likely lifted near Cornelius Rd and One Mile Rd but not without uprooting a hardwood tree and couple more large branches being snapped. Light straight line wind damage was noted further south, but no convergence was able to be determined.</p>

	06/17/23 15:47 CST		0	Source: NWS Storm Survey
<p>A miniature supercell produced a weak tornado northeast of Elsanor on the evening of 6/17/2023. After analyzing storm chaser footage and radar data along with damage reports it was determined the tornado began around 430 PM CDT just north of I-10 west of County Road 87 and tracked southeast across I-10 near the intersection of County Road 87. It was here where there were reports of some snapped off tree limbs. The rest of the evolution of the tornado is unique as it slowed and stalled for a brief period over forest to the north of Timber Company Road before occluding to the northeast, crossing I-10 near mile marker 59. This is where additional tree damage was observed and lines up well with the radar couplet. It is possible the tornado became stronger after crossing I-10 for the second time as the rotational velocity increased notably, however this area to the north of I-10 is primarily forest and limited road access. Thus, the end point of the tornado is being estimated by the weakening of the radar velocity couplet and the reports from storm chasers.</p>				
<p>Unusually strong wind shear combined with strong instability and numerous disturbances led to a very active period of severe weather through the month of June. Numerous reports of large hail and damaging winds were recorded along with a few tornadoes.</p>

Storm Data and Unusual Weather Phenomena - June 2023

Location	Date/Time	Deaths & Injuries	Property & Crop Dmg	Event Type and Details
<p>A tornado began just west of Benton Road in the trees prior to moving over a field and farmhouse. It was here that the first notable damage occurred. A farm building had its entire roof removed which was reinforced with hurricane straps. This would likely have required around 100mph wind gusts to accomplish. The roofing material was quickly wrapped around the tornadic circulation and thrown back and wrapped around the trees behind the building. In addition to this, inflow winds rapidly strengthened with a tree stand to the southwest having multiple trees snapped and uprooted facing towards the northeast, resulting in the tornadic circulation being approximately 230 yards here. A garage attached to the home just east of the farm building had 50% of its roofing material removed and likewise thrown towards the back. A small outbuilding at this location was destroyed with debris thrown across the field. The tornado continued across the field into an area of forest where drone footage revealed multiple snaps and uproots along a narrow corridor around 100 yards wide. The tornado appears to have shrunk in size as it approaches the next home southeast of the field where a single tree uproot occurred along with a small outbuilding being damaged. It is likely the tornado continued to the southeast and potentially strengthened, however the area is difficult to access and will likely need to be assessed via high resolution satellite imagery when available. Special thanks to Baldwin County EMA for providing drone footage of this part of the tornado path.</p>
