

High Winds on February 11, 2009

High winds on Wednesday, Feb. 11 were the result of a deepening low pressure system that tracked northeast across Missouri to the Great Lakes region.

The strong winds brought down tree limbs and utility infrastructure that was already weakened by the historic January 27 ice storm. Power outages were reported in many places where power had been restored following the ice storm. Prior to the onset of high winds, power had not been restored to thousands of utility customers affected by the ice storm.

Below is a preliminary listing of measured wind gusts on Feb. 11. The gusts plotted on the map were measured at airport sites by automated equipment. One of the highest gusts measured at a non-airport site was 63 mph at a mesonet site at Madisonville, KY.
