        return synthRes;
    }
}
```

- For API details, see SynthesizeSpeech in *AWS SDK for Java 2.x API Reference*.

Scenarios

Create an application to analyze customer feedback

The following code example shows how to create an application that analyzes customer comment cards, translates them from their original language, determines their sentiment, and generates an audio file from the translated text.

SDK for Java 2.x

This example application analyzes and stores customer feedback cards. Specifically, it fulfills the need of a fictitious hotel in New York City. The hotel receives feedback from guests in various languages in the form of physical comment cards. That feedback is uploaded into the app through a web client. After an image of a comment card is uploaded, the following steps occur:

- Text is extracted from the image using Amazon Textract.
- Amazon Comprehend determines the sentiment of the extracted text and its language.
- The extracted text is translated to English using Amazon Translate.
- Amazon Polly synthesizes an audio file from the extracted text.

The full app can be deployed with the AWS CDK. For source code and deployment instructions, see the project in GitHub.

Services used in this example

- Amazon Comprehend
- Lambda
- Amazon Polly
- Amazon Textract
- Amazon Translate

Amazon RDS examples using SDK for Java 2.x

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Java 2.x with Amazon RDS.

Basics are code examples that show you how to perform the essential operations within a service.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Scenarios are code examples that show you how to accomplish specific tasks by calling multiple functions within a service or combined with other AWS services.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Get started

Hello Amazon RDS

The following code examples show how to get started using Amazon RDS.

SDK for Java 2.x

Basics

Learn the basics

The following code example shows how to:

- Create a custom DB parameter group and set parameter values.
- Create a DB instance that's configured to use the parameter group. The DB instance also contains a database.
- Take a snapshot of the instance.
- Delete the instance and parameter group.

SDK for Java 2.x

/**
 * Before running this Java (v2) code example, set up your development
 * environment, including your credentials.
 *
 * For more information, see the following documentation topic:
 *
 * https://docs.aws.amazon.com/sdk-for-java/latest/developer-guide/get-started.html
 *
 * This example requires an AWS Secrets Manager secret that contains the
 * database credentials. If you do not create a
 * secret, this example will not work. For details, see:
 *
 * https://docs.aws.amazon.com/secretsmanager/latest/userguide/integrating_how-
services-use-secrets_RS.html
 *
 * This Java example performs these tasks:
 *
 * 1. Returns a list of the available DB engines.
 * 2. Selects an engine family and create a custom DB parameter group.
 * 3. Gets the parameter groups.
 * 4. Gets parameters in the group.
 * 5. Modifies the auto_increment_offset parameter.
 * 6. Gets and displays the updated parameters.
 * 7. Gets a list of allowed engine versions.
 * 8. Gets a list of micro instance classes available for the selected engine.
 * 9. Creates an RDS database instance that contains a MySql database and uses
 * the parameter group.
 * 10. Waits for the DB instance to be ready and prints out the connection
 * endpoint value.
 * 11. Creates a snapshot of the DB instance.
 * 12. Waits for an RDS DB snapshot to be ready.
 * 13. Deletes the RDS DB instance.
 * 14. Deletes the parameter group.
 */
```

Scenarios

Create an Aurora Serverless work item tracker

The following code example shows how to create a web application that tracks work items in an Amazon Aurora Serverless database and uses Amazon Simple Email Service (Amazon SES) to send reports.

SDK for Java 2.x

Shows how to create a web application that tracks and reports on work items stored in an Amazon RDS database.

For complete source code and instructions on how to set up a Spring REST API that queries Amazon Aurora Serverless data and for use by a React application, see the full example on GitHub.

For complete source code and instructions on how to set up and run an example that uses the JDBC API, see the full example on GitHub.

Services used in this example

- Aurora
- Amazon RDS
- Amazon RDS Data Service
- Amazon SES

Serverless examples

Connecting to an Amazon RDS database in a Lambda function

The following code example shows how to implement a Lambda function that connects to an RDS database. The function makes a simple database request and returns the result.

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Serverless examples repository.

Connecting to an Amazon RDS database in a Lambda function using Java.

```

Amazon RDS Data Service examples using SDK for Java 2.x

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Java 2.x with Amazon RDS Data Service.

Scenarios are code examples that show you how to accomplish specific tasks by calling multiple functions within a service or combined with other AWS services.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Scenarios

Scenarios

Create an Aurora Serverless work item tracker

The following code example shows how to create a web application that tracks work items in an Amazon Aurora Serverless database and uses Amazon Simple Email Service (Amazon SES) to send reports.

SDK for Java 2.x

Shows how to create a web application that tracks and reports on work items stored in an Amazon RDS database.

For complete source code and instructions on how to set up a Spring REST API that queries Amazon Aurora Serverless data and for use by a React application, see the full example on GitHub.

For complete source code and instructions on how to set up and run an example that uses the JDBC API, see the full example on GitHub.

Services used in this example

- Aurora
- Amazon RDS
- Amazon RDS Data Service
- Amazon SES

Amazon Redshift examples using SDK for Java 2.x

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Java 2.x with Amazon Redshift.

Basics are code examples that show you how to perform the essential operations within a service.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Scenarios are code examples that show you how to accomplish specific tasks by calling multiple functions within a service or combined with other AWS services.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Get started

Hello Amazon Redshift

The following code examples show how to get started using Amazon Redshift.

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
import software.amazon.awssdk.regions.Region;
import software.amazon.awssdk.services.redshift.RedshiftClient;
import software.amazon.awssdk.services.redshift.paginators.DescribeClustersIterable;

/**
 * Before running this Java V2 code example, set up your development
 * environment, including your credentials.
 *
 * For more information, see the following documentation topic:
 *
 * https://docs.aws.amazon.com/sdk-for-java/latest/developer-guide/get-started.html
 */
```

```
public class HelloRedshift {
    public static void main(String[] args) {
        Region region = Region.US_EAST_1;
        RedshiftClient redshiftClient = RedshiftClient.builder()
            .region(region)
            .build();

        listClustersPaginator(redshiftClient);
    }

    public static void listClustersPaginator(RedshiftClient redshiftClient) {
        DescribeClustersIterable clustersIterable =
 redshiftClient.describeClustersPaginator();
        clustersIterable.stream()
            .flatMap(r -> r.clusters().stream())
            .forEach(cluster -> System.out
                .println(" Cluster identifier: " + cluster.clusterIdentifier() + "
 status = " + cluster.clusterStatus()));
    }
}
```

- For API details, see DescribeClusters in *AWS SDK for Java 2.x API Reference*.

Topics

- Basics
- Actions
- Scenarios

Basics

Learn the basics

The following code example shows how to:

- Create a Redshift cluster.
- List databases in the cluster.
- Create a table named Movies.
- Populate the Movies table.

- Query the Movies table by year.
- Modify the Redshift cluster.
- Delete the Amazon Redshift cluster.

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Run an interactive scenario demonstrating Amazon Redshift features.

```
import com.example.redshift.User;
import com.google.gson.Gson;
import org.slf4j.Logger;
import org.slf4j.LoggerFactory;
import software.amazon.awssdk.regions.Region;
import software.amazon.awssdk.services.redshift.model.ClusterAlreadyExistsException;
import software.amazon.awssdk.services.redshift.model.CreateClusterResponse;
import software.amazon.awssdk.services.redshift.model.DeleteClusterResponse;
import software.amazon.awssdk.services.redshift.model.ModifyClusterResponse;
import software.amazon.awssdk.services.redshift.model.RedshiftException;
import software.amazon.awssdk.services.redshiftdata.model.ExecuteStatementResponse;
import software.amazon.awssdk.services.redshiftdata.model.RedshiftDataException;
import java.util.Scanner;
import java.util.concurrent.CompletableFuture;
import software.amazon.awssdk.services.secretsmanager.SecretsManagerClient;
import software.amazon.awssdk.services.secretsmanager.model.GetSecretValueRequest;
import software.amazon.awssdk.services.secretsmanager.model.GetSecretValueResponse;

/**
 * Before running this Java V2 code example, set up your development
 * environment, including your credentials.
 *
 * For more information, see the following documentation topic:
 *
 * https://docs.aws.amazon.com/sdk-for-java/latest/developer-guide/get-started.html
 *
 *
```

```
 *  This example requires an AWS Secrets Manager secret that contains the
 *  database credentials. If you do not create a
 *  secret that specifies user name and password, this example will not work. For
 details, see:
 *
 *  https://docs.aws.amazon.com/secretsmanager/latest/userguide/integrating_how-
services-use-secrets_RS.html
 *
 This Java example performs these tasks:
 *
 * 1. Prompts the user for a unique cluster ID or use the default value.
 * 2. Creates a Redshift cluster with the specified or default cluster Id value.
 * 3. Waits until the Redshift cluster is available for use.
 * 4. Lists all databases using a pagination API call.
 * 5. Creates a table named "Movies" with fields ID, title, and year.
 * 6. Inserts a specified number of records into the "Movies" table by reading the
 Movies JSON file.
 * 7. Prompts the user for a movie release year.
 * 8. Runs a SQL query to retrieve movies released in the specified year.
 * 9. Modifies the Redshift cluster.
 * 10. Prompts the user for confirmation to delete the Redshift cluster.
 * 11. If confirmed, deletes the specified Redshift cluster.
 */

`ListDatabases`

The following code example shows how to use `ListDatabases`.

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
    /**
     * Lists all databases asynchronously for the specified cluster, database user,
and database.
     * @param clusterId the identifier of the cluster to list databases for
     * @param dbUser the database user to use for the list databases request
     * @param database the database to list databases for
     * @return a {@link CompletableFuture} that completes when the database listing
is complete, or throws a {@link RuntimeException} if there was an error
     */
    public CompletableFuture<Void> listAllDatabasesAsync(String clusterId, String
dbUser, String database) {
        ListDatabasesRequest databasesRequest = ListDatabasesRequest.builder()
            .clusterIdentifier(clusterId)
            .dbUser(dbUser)
            .database(database)
            .build();
```

```
        // Asynchronous paginator for listing databases.
        ListDatabasesPublisher databasesPaginator =
getAsyncDataClient().listDatabasesPaginator(databasesRequest);
        CompletableFuture<Void> future = databasesPaginator.subscribe(response -> {
            response.databases().forEach(db -> {
                logger.info("The database name is {} ", db);
            });
        });

        // Return the future for asynchronous handling.
        return future.exceptionally(exception -> {
            throw new RuntimeException("Failed to list databases: " +
exception.getMessage(), exception);
        });
    }
```

- For API details, see ListDatabases in *AWS SDK for Java 2.x API Reference*.

`ModifyCluster`

The following code example shows how to use `ModifyCluster`.

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Modify a cluster.

```
    /**
     * Modifies an Amazon Redshift cluster asynchronously.
     *
     * @param clusterId the identifier of the cluster to be modified
     * @return a {@link CompletableFuture} that completes when the cluster
modification is complete
     */
```

```
   public CompletableFuture<ModifyClusterResponse> modifyClusterAsync(String
clusterId) {
       ModifyClusterRequest modifyClusterRequest = ModifyClusterRequest.builder()
           .clusterIdentifier(clusterId)
           .preferredMaintenanceWindow("wed:07:30-wed:08:00")
           .build();

       return getAsyncClient().modifyCluster(modifyClusterRequest)
           .whenComplete((clusterResponse, exception) -> {
               if (exception != null) {
                   if (exception.getCause() instanceof RedshiftException) {
                       logger.info("Error: {} ", exception.getMessage());
                   } else {
                       logger.info("Unexpected error: {} ",
exception.getMessage());
                   }
               } else {
                   logger.info("The modified cluster was successfully modified and
has "
                       + clusterResponse.cluster().preferredMaintenanceWindow() + "
as the maintenance window");
               }
           });
   }
```

- For API details, see ModifyCluster in *AWS SDK for Java 2.x API Reference*.

Scenarios

Create a web application to track Amazon Redshift data

The following code example shows how to create a web application that tracks and reports on work items using an Amazon Redshift database.

SDK for Java 2.x

Shows how to create a web application that tracks and reports on work items stored in an Amazon Redshift database.

For complete source code and instructions on how to set up a Spring REST API that queries Amazon Redshift data and for use by a React application, see the full example on GitHub.

Services used in this example

- Amazon Redshift
- Amazon SES

Amazon Rekognition examples using SDK for Java 2.x

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Java 2.x with Amazon Rekognition.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Scenarios are code examples that show you how to accomplish specific tasks by calling multiple functions within a service or combined with other AWS services.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Scenarios

Create a serverless application to manage photos

The following code example shows how to create a serverless application that lets users manage photos using labels.

SDK for Java 2.x

Shows how to develop a photo asset management application that detects labels in images using Amazon Rekognition and stores them for later retrieval.

For complete source code and instructions on how to set up and run, see the full example on GitHub.

For a deep dive into the origin of this example see the post on AWS Community.

Services used in this example

- API Gateway
- DynamoDB
- Lambda
- Amazon Rekognition
- Amazon S3
- Amazon SNS

Detect PPE in images

The following code example shows how to build an app that uses Amazon Rekognition to detect Personal Protective Equipment (PPE) in images.

SDK for Java 2.x

Shows how to create an AWS Lambda function that detects images with Personal Protective Equipment.

For complete source code and instructions on how to set up and run, see the full example on GitHub.

Services used in this example

- DynamoDB
- Amazon Rekognition
- Amazon S3
- Amazon SES

Detect information in videos

The following code example shows how to:

- Start Amazon Rekognition jobs to detect elements like people, objects, and text in videos.
- Check job status until jobs finish.
- Output the list of elements detected by each job.

SDK for Java 2.x

Detect objects in images

The following code example shows how to build an app that uses Amazon Rekognition to detect objects by category in images.

SDK for Java 2.x

Shows how to use Amazon Rekognition Java API to create an app that uses Amazon Rekognition to identify objects by category in images located in an Amazon Simple Storage Service (Amazon S3) bucket. The app sends the admin an email notification with the results using Amazon Simple Email Service (Amazon SES).

For complete source code and instructions on how to set up and run, see the full example on GitHub.

Services used in this example

- Amazon Rekognition
- Amazon S3
- Amazon SES

Detect people and objects in a video

The following code example shows how to detect people and objects in a video with Amazon Rekognition.

SDK for Java 2.x

Shows how to use Amazon Rekognition Java API to create an app to detect faces and objects in videos located in an Amazon Simple Storage Service (Amazon S3) bucket. The app sends the admin an email notification with the results using Amazon Simple Email Service (Amazon SES).

For complete source code and instructions on how to set up and run, see the full example on GitHub.

Services used in this example

- Amazon Rekognition
- Amazon S3
- Amazon SES
- Amazon SNS
- Amazon SQS

Route 53 domain registration examples using SDK for Java 2.x

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Java 2.x with Route 53 domain registration.

Basics are code examples that show you how to perform the essential operations within a service.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Get started

Hello Route 53 domain registration

The following code examples show how to get started using Route 53 domain registration.

SDK for Java 2.x

Basics

Learn the basics

The following code example shows how to:

- List current domains, and list operations in the past year.
- View billing for the past year, and view prices for domain types.
- Get domain suggestions.
- Check domain availability and transferability.
- Optionally, request a domain registration.
- Get an operation detail.
- Optionally, get a domain detail.

SDK for Java 2.x

> **Note**

Actions

`CheckDomainAvailability`

The following code example shows how to use `CheckDomainAvailability`.

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
   public static void checkDomainAvailability(Route53DomainsClient
route53DomainsClient, String domainSuggestion) {
       try {
           CheckDomainAvailabilityRequest availabilityRequest =
CheckDomainAvailabilityRequest.builder()
                   .domainName(domainSuggestion)
```

```
                    .build();

            CheckDomainAvailabilityResponse response = route53DomainsClient
                    .checkDomainAvailability(availabilityRequest);
            System.out.println(domainSuggestion + " is " +
response.availability().toString());

        } catch (Route53Exception e) {
            System.err.println(e.getMessage());
            System.exit(1);
        }
    }
```

- For API details, see CheckDomainAvailability in *AWS SDK for Java 2.x API Reference*.

`CheckDomainTransferability`

The following code example shows how to use `CheckDomainTransferability`.

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
    public static void checkDomainTransferability(Route53DomainsClient
route53DomainsClient, String domainSuggestion) {
        try {
            CheckDomainTransferabilityRequest transferabilityRequest =
CheckDomainTransferabilityRequest.builder()
                    .domainName(domainSuggestion)
                    .build();

            CheckDomainTransferabilityResponse response = route53DomainsClient
                    .checkDomainTransferability(transferabilityRequest);
            System.out.println("Transferability: " +
response.transferability().transferable().toString());
```

```
        } catch (Route53Exception e) {
            System.err.println(e.getMessage());
            System.exit(1);
        }
    }
```

- For API details, see CheckDomainTransferability in *AWS SDK for Java 2.x API Reference*.

`GetDomainDetail`

The following code example shows how to use `GetDomainDetail`.

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
   public static void getDomainDetails(Route53DomainsClient route53DomainsClient,
String domainSuggestion) {
        try {
            GetDomainDetailRequest detailRequest = GetDomainDetailRequest.builder()
                    .domainName(domainSuggestion)
                    .build();

            GetDomainDetailResponse response =
route53DomainsClient.getDomainDetail(detailRequest);
            System.out.println("The contact first name is " +
response.registrantContact().firstName());
            System.out.println("The contact last name is " +
response.registrantContact().lastName());
            System.out.println("The contact org name is " +
response.registrantContact().organizationName());

        } catch (Route53Exception e) {
            System.err.println(e.getMessage());
            System.exit(1);
        }
```

```
    }
```

- For API details, see GetDomainDetail in *AWS SDK for Java 2.x API Reference*.

`GetDomainSuggestions`

The following code example shows how to use `GetDomainSuggestions`.

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
   public static void listDomainSuggestions(Route53DomainsClient
route53DomainsClient, String domainSuggestion) {
       try {
           GetDomainSuggestionsRequest suggestionsRequest =
GetDomainSuggestionsRequest.builder()
                   .domainName(domainSuggestion)
                   .suggestionCount(5)
                   .onlyAvailable(true)
                   .build();

           GetDomainSuggestionsResponse response =
route53DomainsClient.getDomainSuggestions(suggestionsRequest);
           List<DomainSuggestion> suggestions = response.suggestionsList();
           for (DomainSuggestion suggestion : suggestions) {
               System.out.println("Suggestion Name: " + suggestion.domainName());
               System.out.println("Availability: " + suggestion.availability());
               System.out.println(" ");
           }

       } catch (Route53Exception e) {
           System.err.println(e.getMessage());
           System.exit(1);
       }
   }
```

- For API details, see GetDomainSuggestions in *AWS SDK for Java 2.x API Reference*.

`GetOperationDetail`

The following code example shows how to use `GetOperationDetail`.

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
   public static void getOperationalDetail(Route53DomainsClient
route53DomainsClient, String operationId) {
       try {
           GetOperationDetailRequest detailRequest =
GetOperationDetailRequest.builder()
                   .operationId(operationId)
                   .build();

           GetOperationDetailResponse response =
route53DomainsClient.getOperationDetail(detailRequest);
           System.out.println("Operation detail message is " + response.message());

       } catch (Route53Exception e) {
           System.err.println(e.getMessage());
           System.exit(1);
       }
   }
```

- For API details, see GetOperationDetail in *AWS SDK for Java 2.x API Reference*.

`ListDomains`

The following code example shows how to use `ListDomains`.

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
    public static void listDomains(Route53DomainsClient route53DomainsClient) {
        try {
            ListDomainsIterable listRes =
route53DomainsClient.listDomainsPaginator();
            listRes.stream()
                    .flatMap(r -> r.domains().stream())
                    .forEach(content -> System.out.println("The domain name is " +
content.domainName()));

        } catch (Route53Exception e) {
            System.err.println(e.getMessage());
            System.exit(1);
        }
    }
```

- For API details, see ListDomains in *AWS SDK for Java 2.x API Reference*.

`ListOperations`

The following code example shows how to use `ListOperations`.

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
    public static void listOperations(Route53DomainsClient route53DomainsClient) {
```

```
        try {
            Date currentDate = new Date();
            LocalDateTime localDateTime =
currentDate.toInstant().atZone(ZoneId.systemDefault()).toLocalDateTime();
            ZoneOffset zoneOffset = ZoneOffset.of("+01:00");
            localDateTime = localDateTime.minusYears(1);
            Instant myTime = localDateTime.toInstant(zoneOffset);

            ListOperationsRequest operationsRequest =
ListOperationsRequest.builder()
                    .submittedSince(myTime)
                    .build();

            ListOperationsIterable listRes =
route53DomainsClient.listOperationsPaginator(operationsRequest);
            listRes.stream()
                    .flatMap(r -> r.operations().stream())
                    .forEach(content -> System.out.println(" Operation Id: " +
content.operationId() +
                            " Status: " + content.statusAsString() +
                            " Date: " + content.submittedDate()));

        } catch (Route53Exception e) {
            System.err.println(e.getMessage());
            System.exit(1);
        }
    }
```

- For API details, see ListOperations in *AWS SDK for Java 2.x API Reference*.

`ListPrices`

The following code example shows how to use `ListPrices`.

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
   public static void listPrices(Route53DomainsClient route53DomainsClient, String
domainType) {
       try {
           ListPricesRequest pricesRequest = ListPricesRequest.builder()
                   .tld(domainType)
                   .build();

           ListPricesIterable listRes =
route53DomainsClient.listPricesPaginator(pricesRequest);
           listRes.stream()
                   .flatMap(r -> r.prices().stream())
                   .forEach(content -> System.out.println(" Name: " +
content.name() +
                           " Registration: " + content.registrationPrice().price()
+ " "
                           + content.registrationPrice().currency() +
                           " Renewal: " + content.renewalPrice().price() + " " +
content.renewalPrice().currency()));

       } catch (Route53Exception e) {
           System.err.println(e.getMessage());
           System.exit(1);
       }
   }
```

- For API details, see ListPrices in *AWS SDK for Java 2.x API Reference*.

`RegisterDomain`

The following code example shows how to use `RegisterDomain`.

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
   public static String requestDomainRegistration(Route53DomainsClient
route53DomainsClient,
           String domainSuggestion,
           String phoneNumber,
           String email,
           String firstName,
           String lastName,
           String city) {

       try {
           ContactDetail contactDetail = ContactDetail.builder()
                   .contactType(ContactType.COMPANY)
                   .state("LA")
                   .countryCode(CountryCode.IN)
                   .email(email)
                   .firstName(firstName)
                   .lastName(lastName)
                   .city(city)
                   .phoneNumber(phoneNumber)
                   .organizationName("My Org")
                   .addressLine1("My Address")
                   .zipCode("123 123")
                   .build();

           RegisterDomainRequest domainRequest = RegisterDomainRequest.builder()
                   .adminContact(contactDetail)
                   .registrantContact(contactDetail)
                   .techContact(contactDetail)
                   .domainName(domainSuggestion)
                   .autoRenew(true)
                   .durationInYears(1)
                   .build();

           RegisterDomainResponse response =
route53DomainsClient.registerDomain(domainRequest);
           System.out.println("Registration requested. Operation Id: " +
response.operationId());
           return response.operationId();

       } catch (Route53Exception e) {
           System.err.println(e.getMessage());
           System.exit(1);
       }
```

```
        return "";
    }
```

- For API details, see RegisterDomain in *AWS SDK for Java 2.x API Reference*.

`ViewBilling`

The following code example shows how to use `ViewBilling`.

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
   public static void listBillingRecords(Route53DomainsClient route53DomainsClient)
{
       try {
           Date currentDate = new Date();
           LocalDateTime localDateTime =
currentDate.toInstant().atZone(ZoneId.systemDefault()).toLocalDateTime();
           ZoneOffset zoneOffset = ZoneOffset.of("+01:00");
           LocalDateTime localDateTime2 = localDateTime.minusYears(1);
           Instant myStartTime = localDateTime2.toInstant(zoneOffset);
           Instant myEndTime = localDateTime.toInstant(zoneOffset);

           ViewBillingRequest viewBillingRequest = ViewBillingRequest.builder()
                   .start(myStartTime)
                   .end(myEndTime)
                   .build();

           ViewBillingIterable listRes =
route53DomainsClient.viewBillingPaginator(viewBillingRequest);
           listRes.stream()
                   .flatMap(r -> r.billingRecords().stream())
                   .forEach(content -> System.out.println(" Bill Date:: " +
content.billDate() +
                           " Operation: " + content.operationAsString() +
                           " Price: " + content.price()));
```

```
        } catch (Route53Exception e) {
            System.err.println(e.getMessage());
            System.exit(1);
        }
    }
```

- For API details, see ViewBilling in *AWS SDK for Java 2.x API Reference*.

Amazon S3 examples using SDK for Java 2.x

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Java 2.x with Amazon S3.

Basics are code examples that show you how to perform the essential operations within a service.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Scenarios are code examples that show you how to accomplish specific tasks by calling multiple functions within a service or combined with other AWS services.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Get started

Hello Amazon S3

The following code examples show how to get started using Amazon S3.

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
import software.amazon.awssdk.regions.Region;
import software.amazon.awssdk.services.s3.S3Client;
import software.amazon.awssdk.services.s3.model.Bucket;
import software.amazon.awssdk.services.s3.model.ListBucketsResponse;
import software.amazon.awssdk.services.s3.model.S3Exception;
import java.util.List;

/**
 * Before running this Java V2 code example, set up your development
 * environment, including your credentials.
 * <p>
 * For more information, see the following documentation topic:
 * <p>
 * https://docs.aws.amazon.com/sdk-for-java/latest/developer-guide/get-started.html
 */
public class HelloS3 {
    public static void main(String[] args) {
        Region region = Region.US_EAST_1;
        S3Client s3 = S3Client.builder()
            .region(region)
            .build();

        listBuckets(s3);
    }

    /**
     * Lists all the S3 buckets associated with the provided AWS S3 client.
     *
     * @param s3 the S3Client instance used to interact with the AWS S3 service
     */
    public static void listBuckets(S3Client s3) {
        try {
            ListBucketsResponse response = s3.listBuckets();
            List<Bucket> bucketList = response.buckets();
            bucketList.forEach(bucket -> {
                System.out.println("Bucket Name: " + bucket.name());
            });

        } catch (S3Exception e) {
            System.err.println(e.awsErrorDetails().errorMessage());
            System.exit(1);
        }
    }
}
```

- For API details, see ListBuckets in *AWS SDK for Java 2.x API Reference*.

Topics

- Basics
- Actions
- Scenarios
- Serverless examples

Basics

Learn the basics

The following code example shows how to:

- Create a bucket and upload a file to it.
- Download an object from a bucket.
- Copy an object to a subfolder in a bucket.
- List the objects in a bucket.
- Delete the bucket objects and the bucket.

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

A scenario example.

```
import java.io.IOException;
import java.util.Scanner;
import java.util.UUID;
import java.util.concurrent.CompletableFuture;
```

```
import org.slf4j.Logger;
import org.slf4j.LoggerFactory;
import software.amazon.awssdk.services.s3.model.PutObjectResponse;
import software.amazon.awssdk.services.s3.model.S3Exception;

/**
 * Before running this Java V2 code example, set up your development
 * environment, including your credentials.
 *
 * For more information, see the following documentation topic:
 *
 * https://docs.aws.amazon.com/sdk-for-java/latest/developer-guide/get-started.html
 *
 * This Java code example performs the following tasks:
 *
 * 1. Creates an Amazon S3 bucket.
 * 2. Uploads an object to the bucket.
 * 3. Downloads the object to another local file.
 * 4. Uploads an object using multipart upload.
 * 5. List all objects located in the Amazon S3 bucket.
 * 6. Copies the object to another Amazon S3 bucket.
 * 7. Copy the object to another Amazon S3 bucket using multi copy.
 * 8. Deletes the object from the Amazon S3 bucket.
 * 9. Deletes the Amazon S3 bucket.
 */

public class S3Scenario {

    public static Scanner scanner = new Scanner(System.in);

            logger.info(usage);
            return;
        }

        String bucketName = args[0];
        String key = args[1];
        String objectPath = args[2];
        String savePath = args[3];
        String toBucket = args[4];

        logger.info(DASHES);
        logger.info("Welcome to the Amazon Simple Storage Service (S3) example
scenario.");
        logger.info("""
            Amazon S3 is a highly scalable and durable object storage
            service provided by Amazon Web Services (AWS). It is designed to store
and retrieve
            any amount of data, from anywhere on the web, at any time.

            The `S3AsyncClient` interface in the AWS SDK for Java 2.x provides a set
of methods to
            programmatically interact with the Amazon S3 (Simple Storage Service)
service. This allows
            developers to automate the management and manipulation of S3 buckets and
objects as
            part of their application deployment pipelines. With S3, teams can focus
on building
            and deploying their applications without having to worry about the
underlying storage
            infrastructure required to host and manage large amounts of data.

            This scenario walks you through how to perform key operations for this
service.

`CopyObject`

The following code example shows how to use `CopyObject`.

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Copy an object using an S3Client.

```
   /**
    * Asynchronously copies an object from one S3 bucket to another.
    *
    * @param fromBucket the name of the source S3 bucket
    * @param objectKey  the key (name) of the object to be copied
    * @param toBucket   the name of the destination S3 bucket
    * @return a {@link CompletableFuture} that completes with the copy result as a
{@link String}
    * @throws RuntimeException if the URL could not be encoded or an S3 exception
occurred during the copy
    */
   public CompletableFuture<String> copyBucketObjectAsync(String fromBucket, String
objectKey, String toBucket) {
       CopyObjectRequest copyReq = CopyObjectRequest.builder()
           .sourceBucket(fromBucket)
           .sourceKey(objectKey)
           .destinationBucket(toBucket)
           .destinationKey(objectKey)
           .build();

       CompletableFuture<CopyObjectResponse> response =
getAsyncClient().copyObject(copyReq);
       response.whenComplete((copyRes, ex) -> {
           if (copyRes != null) {
               logger.info("The " + objectKey + " was copied to " + toBucket);
           } else {
               throw new RuntimeException("An S3 exception occurred during copy",
ex);
           }
       });

       return response.thenApply(CopyObjectResponse::copyObjectResult)
```

```
            .thenApply(Object::toString);
    }
```

Use an S3TransferManager to copy an object from one bucket to another. View the complete file and test.

`CreateBucket`

The following code example shows how to use `CreateBucket`.

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Create a bucket.

```
   /**
    * Creates an S3 bucket asynchronously.
    *
    * @param bucketName the name of the S3 bucket to create
    * @return a {@link CompletableFuture} that completes when the bucket is created
and ready
    * @throws RuntimeException if there is a failure while creating the bucket
    */
   public CompletableFuture<Void> createBucketAsync(String bucketName) {
       CreateBucketRequest bucketRequest = CreateBucketRequest.builder()
           .bucket(bucketName)
           .build();

       CompletableFuture<CreateBucketResponse> response =
getAsyncClient().createBucket(bucketRequest);
       return response.thenCompose(resp -> {
           S3AsyncWaiter s3Waiter = getAsyncClient().waiter();
           HeadBucketRequest bucketRequestWait = HeadBucketRequest.builder()
               .bucket(bucketName)
               .build();

           CompletableFuture<WaiterResponse<HeadBucketResponse>>
waiterResponseFuture =
               s3Waiter.waitUntilBucketExists(bucketRequestWait);
           return waiterResponseFuture.thenAccept(waiterResponse -> {
               waiterResponse.matched().response().ifPresent(headBucketResponse ->
{
                   logger.info(bucketName + " is ready");
```

```
                });
            });
        }).whenComplete((resp, ex) -> {
            if (ex != null) {
                throw new RuntimeException("Failed to create bucket", ex);
            }
        });
    }
```

Create a bucket with object lock enabled.

```
    // Create a new Amazon S3 bucket with object lock options.
    public void createBucketWithLockOptions(boolean enableObjectLock, String
bucketName) {
        S3Waiter s3Waiter = getClient().waiter();
        CreateBucketRequest bucketRequest = CreateBucketRequest.builder()
            .bucket(bucketName)
            .objectLockEnabledForBucket(enableObjectLock)
            .build();

        getClient().createBucket(bucketRequest);
        HeadBucketRequest bucketRequestWait = HeadBucketRequest.builder()
            .bucket(bucketName)
            .build();

        // Wait until the bucket is created and print out the response.
        s3Waiter.waitUntilBucketExists(bucketRequestWait);
        System.out.println(bucketName + " is ready");
    }
```

- For API details, see CreateBucket in *AWS SDK for Java 2.x API Reference*.

`DeleteBucket`

rule.status());

       } catch (S3Exception e) {
           System.err.println("Failed to retrieve replication details: " +
e.awsErrorDetails().errorMessage());
       }
   }
```

- For API details, see GetBucketReplication in *AWS SDK for Java 2.x API Reference*.

`GetObject`

The following code example shows how to use `GetObject`.

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Read data as a byte array using an S3Client.

```
   /**
    * Asynchronously retrieves the bytes of an object from an Amazon S3 bucket and
writes them to a local file.
    *
    * @param bucketName the name of the S3 bucket containing the object
    * @param keyName    the key (or name) of the S3 object to retrieve
    * @param path       the local file path where the object's bytes will be
written
    * @return a {@link CompletableFuture} that completes when the object bytes have
been written to the local file
    */
   public CompletableFuture<Void> getObjectBytesAsync(String bucketName, String
keyName, String path) {
       GetObjectRequest objectRequest = GetObjectRequest.builder()
           .key(keyName)
           .bucket(bucketName)
           .build();

       CompletableFuture<ResponseBytes<GetObjectResponse>> response =
getAsyncClient().getObject(objectRequest, AsyncResponseTransformer.toBytes());
       return response.thenAccept(objectBytes -> {
           try {
               byte[] data = objectBytes.asByteArray();
```

```
                Path filePath = Paths.get(path);
                Files.write(filePath, data);
                logger.info("Successfully obtained bytes from an S3 object");
            } catch (IOException ex) {
                throw new RuntimeException("Failed to write data to file", ex);
            }
        }).whenComplete((resp, ex) -> {
            if (ex != null) {
                throw new RuntimeException("Failed to get object bytes from S3",
ex);
            }
        });
    }
```

Use an S3TransferManager to download an object in an S3 bucket to a local file. View the complete file and test.

```
import org.slf4j.Logger;

`GetObjectLegalHold`

The following code example shows how to use `GetObjectLegalHold`.

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
   // Get the legal hold details for an S3 object.
   public ObjectLockLegalHold getObjectLegalHold(String bucketName, String
objectKey) {
       try {
           GetObjectLegalHoldRequest legalHoldRequest =
GetObjectLegalHoldRequest.builder()
               .bucket(bucketName)
               .key(objectKey)
               .build();

           GetObjectLegalHoldResponse response =
getClient().getObjectLegalHold(legalHoldRequest);
           System.out.println("Object legal hold for " + objectKey + " in " +
bucketName +
               ":\n\tStatus: " + response.legalHold().status());
           return response.legalHold();

       } catch (S3Exception ex) {
           System.out.println("\tUnable to fetch legal hold: '" + ex.getMessage() +
"'");
       }

       return null;
   }
```

- For API details, see GetObjectLegalHold in *AWS SDK for Java 2.x API Reference*.

`GetObjectLockConfiguration`

The following code example shows how to use `GetObjectLockConfiguration`.

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
   // Get the object lock configuration details for an S3 bucket.
   public void getBucketObjectLockConfiguration(String bucketName) {
       GetObjectLockConfigurationRequest objectLockConfigurationRequest =
GetObjectLockConfigurationRequest.builder()
           .bucket(bucketName)
           .build();

       GetObjectLockConfigurationResponse response =
getClient().getObjectLockConfiguration(objectLockConfigurationRequest);
       System.out.println("Bucket object lock config for "+bucketName +":  ");
       System.out.println("\tEnabled:
"+response.objectLockConfiguration().objectLockEnabled());
       System.out.println("\tRule: "+
response.objectLockConfiguration().rule().defaultRetention());
   }
```

- For API details, see GetObjectLockConfiguration in *AWS SDK for Java 2.x API Reference*.

`GetObjectRetention`

The following code example shows how to use `GetObjectRetention`.

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
   // Get the retention period for an S3 object.
```

```
    public ObjectLockRetention getObjectRetention(String bucketName, String key){
        try {

`PutObject`

The following code example shows how to use `PutObject`.

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Upload a file to a bucket using an S3Client.

```
    /**
     * Uploads a local file to an AWS S3 bucket asynchronously.
     *
     * @param bucketName the name of the S3 bucket to upload the file to
     * @param key        the key (object name) to use for the uploaded file
     * @param objectPath the local file path of the file to be uploaded
```

```
     * @return a {@link CompletableFuture} that completes with the {@link
 PutObjectResponse} when the upload is successful, or throws a {@link
 RuntimeException} if the upload fails
     */
    public CompletableFuture<PutObjectResponse> uploadLocalFileAsync(String
 bucketName, String key, String objectPath) {
        PutObjectRequest objectRequest = PutObjectRequest.builder()
            .bucket(bucketName)
            .key(key)
            .build();

        CompletableFuture<PutObjectResponse> response =
 getAsyncClient().putObject(objectRequest,
 AsyncRequestBody.fromFile(Paths.get(objectPath)));
        return response.whenComplete((resp, ex) -> {
            if (ex != null) {
                throw new RuntimeException("Failed to upload file", ex);
            }
        });
    }
```

Use an S3TransferManager to upload a file to a bucket. View the complete file and test.

```
import org.slf4j.Logger;
import org.slf4j.LoggerFactory;
import software.amazon.awssdk.transfer.s3.S3TransferManager;
import software.amazon.awssdk.transfer.s3.model.CompletedFileUpload;

`PutObjectLegalHold`

The following code example shows how to use `PutObjectLegalHold`.

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
   // Set or modify a legal hold on an object in an S3 bucket.
   public void modifyObjectLegalHold(String bucketName, String objectKey, boolean
legalHoldOn) {
       ObjectLockLegalHold legalHold ;
       if (legalHoldOn) {
           legalHold = ObjectLockLegalHold.builder()
               .status(ObjectLockLegalHoldStatus.ON)
               .build();
       } else {
           legalHold = ObjectLockLegalHold.builder()
               .status(ObjectLockLegalHoldStatus.OFF)
               .build();
       }

       PutObjectLegalHoldRequest legalHoldRequest =
PutObjectLegalHoldRequest.builder()
           .bucket(bucketName)
           .key(objectKey)
           .legalHold(legalHold)
           .build();

       getClient().putObjectLegalHold(legalHoldRequest) ;
       System.out.println("Modified legal hold for "+ objectKey +" in "+bucketName
+".");
   }
```

- For API details, see PutObjectLegalHold in *AWS SDK for Java 2.x API Reference*.

`PutObjectLockConfiguration`

The following code example shows how to use `PutObjectLockConfiguration`.

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Set the object lock configuration of a bucket.

```
   // Enable object lock on an existing bucket.
   public void enableObjectLockOnBucket(String bucketName) {
       try {
           VersioningConfiguration versioningConfiguration =
VersioningConfiguration.builder()
                   .status(BucketVersioningStatus.ENABLED)
                   .build();

           PutBucketVersioningRequest putBucketVersioningRequest =
PutBucketVersioningRequest.builder()
                   .bucket(bucketName)
                   .versioningConfiguration(versioningConfiguration)
                   .build();

           // Enable versioning on the bucket.
           getClient().putBucketVersioning(putBucketVersioningRequest);
           PutObjectLockConfigurationRequest request =
PutObjectLockConfigurationRequest.builder()
                   .bucket(bucketName)
                   .objectLockConfiguration(ObjectLockConfiguration.builder()
                       .objectLockEnabled(ObjectLockEnabled.ENABLED)
                       .build())
                   .build();

           getClient().putObjectLockConfiguration(request);
           System.out.println("Successfully enabled object lock on "+bucketName);

       } catch (S3Exception ex) {
           System.out.println("Error modifying object lock: '" + ex.getMessage() +
"'");
       }
   }
```

Set the default retention period of a bucket.

```
   // Set or modify a retention period on an S3 bucket.
   public void modifyBucketDefaultRetention(String bucketName) {
       VersioningConfiguration versioningConfiguration =
VersioningConfiguration.builder()
           .mfaDelete(MFADelete.DISABLED)
           .status(BucketVersioningStatus.ENABLED)
           .build();

       PutBucketVersioningRequest versioningRequest =
PutBucketVersioningRequest.builder()
           .bucket(bucketName)
           .versioningConfiguration(versioningConfiguration)
           .build();

       getClient().putBucketVersioning(versioningRequest);
       DefaultRetention rention = DefaultRetention.builder()
           .days(1)
           .mode(ObjectLockRetentionMode.GOVERNANCE)
           .build();

       ObjectLockRule lockRule = ObjectLockRule.builder()
           .defaultRetention(rention)
           .build();

       ObjectLockConfiguration objectLockConfiguration =
ObjectLockConfiguration.builder()
           .objectLockEnabled(ObjectLockEnabled.ENABLED)
           .rule(lockRule)
           .build();

       PutObjectLockConfigurationRequest putObjectLockConfigurationRequest =
PutObjectLockConfigurationRequest.builder()
           .bucket(bucketName)
           .objectLockConfiguration(objectLockConfiguration)
           .build();

       getClient().putObjectLockConfiguration(putObjectLockConfigurationRequest) ;
       System.out.println("Added a default retention to bucket "+bucketName +".");
   }
```

- For API details, see PutObjectLockConfiguration in *AWS SDK for Java 2.x API Reference*.

`PutObjectRetention`

The following code example shows how to use `PutObjectRetention`.

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
    // Set or modify a retention period on an object in an S3 bucket.
    public void modifyObjectRetentionPeriod(String bucketName, String objectKey) {
        // Calculate the instant one day from now.
        Instant futureInstant = Instant.now().plus(1, ChronoUnit.DAYS);

        // Convert the Instant to a ZonedDateTime object with a specific time zone.
        ZonedDateTime zonedDateTime = futureInstant.atZone(ZoneId.systemDefault());

        // Define a formatter for human-readable output.
        DateTimeFormatter formatter = DateTimeFormatter.ofPattern("yyyy-MM-dd
HH:mm:ss");

        // Format the ZonedDateTime object to a human-readable date string.
        String humanReadableDate = formatter.format(zonedDateTime);

        // Print the formatted date string.
        System.out.println("Formatted Date: " + humanReadableDate);
        ObjectLockRetention retention = ObjectLockRetention.builder()
            .mode(ObjectLockRetentionMode.GOVERNANCE)
            .retainUntilDate(futureInstant)
            .build();

        PutObjectRetentionRequest retentionRequest =
PutObjectRetentionRequest.builder()
            .bucket(bucketName)
            .key(objectKey)
```

```
            .retention(retention)
            .build();

        getClient().putObjectRetention(retentionRequest);
        System.out.println("Set retention for "+objectKey +" in " +bucketName +"
until "+ humanReadableDate +".");
    }
```

- For API details, see PutObjectRetention in *AWS SDK for Java 2.x API Reference*.

`RestoreObject`

UploadPartCopyRequest.builder()
                    .sourceBucket(bucketName)
```

```
                    .destinationBucket(toBucket)
                    .sourceKey(key)
                    .destinationKey(key)
                    .uploadId(uploadId)  // Use the valid uploadId.
                    .partNumber(1)  // Ensure the part number is correct.
                    .copySourceRange("bytes=0-1023")  // Adjust range as needed
                    .build();

                return getAsyncClient().uploadPartCopy(uploadPartCopyRequest);
            })
            .thenCompose(uploadPartCopyFuture -> uploadPartCopyFuture)
            .whenComplete((uploadPartCopyResponse, exception) -> {
                if (exception != null) {
                    // Handle any exceptions.
                    logger.error("Error during upload part copy: " +
exception.getMessage());
                } else {
                    // Successfully completed the upload part copy.
                    System.out.println("Upload Part Copy completed successfully.
ETag: " + uploadPartCopyResponse.copyPartResult().eTag());
                }
            });
        return null;
    }
```

- For API details, see [UploadPartCopy](#) in *AWS SDK for Java 2.x API Reference*.

Scenarios

Check if a bucket exists

The following code example shows how to check if a bucket exists.

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

You can use the following `doesBucketExists` method as a replacement for the the SDK for Java V1 AmazonS3Client#doesBucketExistV2(String) method.

```
import org.slf4j.Logger;
import org.slf4j.LoggerFactory;
import software.amazon.awssdk.awscore.exception.AwsServiceException;
import software.amazon.awssdk.http.HttpStatusCode;
import software.amazon.awssdk.services.s3.S3Client;
import software.amazon.awssdk.utils.Validate;

public class DoesBucketExist {
    private static final Logger logger =
 LoggerFactory.getLogger(DoesBucketExist.class);

    public static void main(String[] args) {
        DoesBucketExist doesBucketExist = new DoesBucketExist();

        final S3Client s3SyncClient = S3Client.builder().build();
        final String bucketName = "amzn-s3-demo-bucket"; // Change to the bucket
 name that you want to check.

        boolean exists = doesBucketExist.doesBucketExist(bucketName, s3SyncClient);
        logger.info("Bucket exists: {}", exists);
    }

    /**
     * Checks if the specified bucket exists. Amazon S3 buckets are named in a
 global namespace; use this method to
     * determine if a specified bucket name already exists, and therefore can't be
 used to create a new bucket.
     * <p>
     * Internally this method uses the <a
     * href="https://sdk.amazonaws.com/java/api/latest/software/amazon/awssdk/
services/s3/
S3Client.html#getBucketAcl(java.util.function.Consumer)">S3Client.getBucketAcl(String)</
a>
     * operation to determine whether the bucket exists.
     * <p>
     * This method is equivalent to the AWS SDK for Java V1's <a
     * href="https://docs.aws.amazon.com/AWSJavaSDK/latest/javadoc/
com/amazonaws/services/s3/AmazonS3Client.html#doesBucketExistV2-
java.lang.String-">AmazonS3Client#doesBucketExistV2(String)</a>.
```

```
     *
     * @param bucketName   The name of the bucket to check.
     * @param s3SyncClient An <code>S3Client</code> instance. The method checks for
 the bucket in the AWS Region
     *                     configured on the instance.
     * @return The value true if the specified bucket exists in Amazon S3; the value
 false if there is no bucket in
     *         Amazon S3 with that name.
     */
    public boolean doesBucketExist(String bucketName, S3Client s3SyncClient) {
        try {
            Validate.notEmpty(bucketName, "The bucket name must not be null or an
 empty string.", "");
            s3SyncClient.getBucketAcl(r -> r.bucket(bucketName));
            return true;
        } catch (AwsServiceException ase) {
            // A redirect error or an AccessDenied exception means the bucket exists
 but it's not in this region
            // or we don't have permissions to it.
            if ((ase.statusCode() == HttpStatusCode.MOVED_PERMANENTLY) ||
 "AccessDenied".equals(ase.awsErrorDetails().errorCode())) {
                return true;
            }
            if (ase.statusCode() == HttpStatusCode.NOT_FOUND) {
                return false;
            }
            throw ase;
        }
    }
}
```

- For API details, see GetBucketAcl in *AWS SDK for Java 2.x API Reference*.

Create a presigned URL

The following code example shows how to create a presigned URL for Amazon S3 and upload an object.

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

The following shows three example of how to create presigned URLs and use the URLs with HTTP client libraries:

- An HTTP GET request that uses the URL with three HTTP client libraries
- An HTTP PUT request with metadata in headers that uses the URL with three HTTP client libraries
- An HTTP PUT request with query parameters that uses the URL with one HTTP client library

Generate a pre-signed URL for an object, then download it (GET request).

Imports.

```
import com.example.s3.util.PresignUrlUtils;
import org.slf4j.Logger;
import software.amazon.awssdk.http.HttpExecuteRequest;
import software.amazon.awssdk.http.HttpExecuteResponse;
import software.amazon.awssdk.http.SdkHttpClient;
import software.amazon.awssdk.http.SdkHttpMethod;
import software.amazon.awssdk.http.SdkHttpRequest;
import software.amazon.awssdk.http.apache.ApacheHttpClient;
import software.amazon.awssdk.services.s3.S3Client;
import software.amazon.awssdk.services.s3.model.GetObjectRequest;
import software.amazon.awssdk.services.s3.model.S3Exception;
import software.amazon.awssdk.services.s3.presigner.S3Presigner;
import software.amazon.awssdk.services.s3.presigner.model.GetObjectPresignRequest;
import software.amazon.awssdk.services.s3.presigner.model.PresignedGetObjectRequest;
import software.amazon.awssdk.utils.IoUtils;

import java.io.ByteArrayOutputStream;
import java.io.File;
import java.io.IOException;
import java.io.InputStream;
import java.net.HttpURLConnection;
import java.net.URISyntaxException;
```

```
import java.net.URL;
import java.net.http.HttpClient;
import java.net.http.HttpRequest;
import java.net.http.HttpResponse;
import java.nio.file.Paths;
import java.time.Duration;
import java.util.UUID;
```

Generate the URL.

```
    /* Create a pre-signed URL to download an object in a subsequent GET request. */
    public String createPresignedGetUrl(String bucketName, String keyName) {
        try (S3Presigner presigner = S3Presigner.create()) {

            GetObjectRequest objectRequest = GetObjectRequest.builder()
                    .bucket(bucketName)
                    .key(keyName)
                    .build();

            GetObjectPresignRequest presignRequest =
 GetObjectPresignRequest.builder()
                    .signatureDuration(Duration.ofMinutes(10))  // The URL will
 expire in 10 minutes.
                    .getObjectRequest(objectRequest)
                    .build();

            PresignedGetObjectRequest presignedRequest =
 presigner.presignGetObject(presignRequest);
            logger.info("Presigned URL: [{}]", presignedRequest.url().toString());
            logger.info("HTTP method: [{}]",
 presignedRequest.httpRequest().method());

            return presignedRequest.url().toExternalForm();
        }
    }
```

Download the object by using any one of the following three approaches.

Use JDK `HttpURLConnection` (since v1.1) class to do the download.

```
    /* Use the JDK HttpURLConnection (since v1.1) class to do the download. */
```

```
    public byte[] useHttpUrlConnectionToGet(String presignedUrlString) {
        ByteArrayOutputStream byteArrayOutputStream = new
ByteArrayOutputStream(); // Capture the response body to a byte array.

        try {
            URL presignedUrl = new URL(presignedUrlString);
            HttpURLConnection connection = (HttpURLConnection)
presignedUrl.openConnection();
            connection.setRequestMethod("GET");
            // Download the result of executing the request.
            try (InputStream content = connection.getInputStream()) {
                IoUtils.copy(content, byteArrayOutputStream);
            }
            logger.info("HTTP response code is " + connection.getResponseCode());

        } catch (S3Exception | IOException e) {
            logger.error(e.getMessage(), e);
        }
        return byteArrayOutputStream.toByteArray();
    }
```

Use JDK `HttpClient` (since v11) class to do the download.

```
    /* Use the JDK HttpClient (since v11) class to do the download. */
    public byte[] useHttpClientToGet(String presignedUrlString) {
        ByteArrayOutputStream byteArrayOutputStream = new
ByteArrayOutputStream(); // Capture the response body to a byte array.

        HttpRequest.Builder requestBuilder = HttpRequest.newBuilder();
        HttpClient httpClient = HttpClient.newHttpClient();
        try {
            URL presignedUrl = new URL(presignedUrlString);
            HttpResponse<InputStream> response = httpClient.send(requestBuilder
                            .uri(presignedUrl.toURI())
                            .GET()
                            .build(),
                    HttpResponse.BodyHandlers.ofInputStream());

            IoUtils.copy(response.body(), byteArrayOutputStream);

            logger.info("HTTP response code is " + response.statusCode());
```

```
        } catch (URISyntaxException | InterruptedException | IOException e) {
            logger.error(e.getMessage(), e);
        }
        return byteArrayOutputStream.toByteArray();
    }
```

Use the AWS SDK for Java SdkHttpClient class to do the download.

```
    /* Use the AWS SDK for Java SdkHttpClient class to do the download. */
    public byte[] useSdkHttpClientToPut(String presignedUrlString) {

        ByteArrayOutputStream byteArrayOutputStream = new
ByteArrayOutputStream(); // Capture the response body to a byte array.
        try {
            URL presignedUrl = new URL(presignedUrlString);
            SdkHttpRequest request = SdkHttpRequest.builder()
                    .method(SdkHttpMethod.GET)
                    .uri(presignedUrl.toURI())
                    .build();

            HttpExecuteRequest executeRequest = HttpExecuteRequest.builder()
                    .request(request)
                    .build();

            try (SdkHttpClient sdkHttpClient = ApacheHttpClient.create()) {
                HttpExecuteResponse response =
sdkHttpClient.prepareRequest(executeRequest).call();
                response.responseBody().ifPresentOrElse(
                        abortableInputStream -> {
                            try {
                                IoUtils.copy(abortableInputStream,
byteArrayOutputStream);
                            } catch (IOException e) {
                                throw new RuntimeException(e);
                            }
                        },
                        () -> logger.error("No response body."));

                logger.info("HTTP Response code is {}",
response.httpResponse().statusCode());
            }
        } catch (URISyntaxException | IOException e) {
```

```
            logger.error(e.getMessage(), e);
        }
        return byteArrayOutputStream.toByteArray();
    }
```

Generate a pre-signed URL with metadata in headers for an upload, then upload a file (PUT request).

   }
```

Upload a file object by using any one of the following three approaches.

Use the JDK `HttpURLConnection` (since v1.1) class to do the upload.

```
   /* Use the JDK HttpURLConnection (since v1.1) class to do the upload. */
   public void useHttpUrlConnectionToPut(String presignedUrlString, File fileToPut,
Map<String, String> metadata) {
```

```
        logger.info("Begin [{}] upload", fileToPut.toString());
        try {
            URL presignedUrl = new URL(presignedUrlString);
            HttpURLConnection connection = (HttpURLConnection)
presignedUrl.openConnection();
            connection.setDoOutput(true);
            metadata.forEach((k, v) -> connection.setRequestProperty("x-amz-meta-" +
k, v));
            connection.setRequestMethod("PUT");
            OutputStream out = connection.getOutputStream();

            try (RandomAccessFile file = new RandomAccessFile(fileToPut, "r");
                 FileChannel inChannel = file.getChannel()) {
                ByteBuffer buffer = ByteBuffer.allocate(8192); //Buffer size is 8k

                while (inChannel.read(buffer) > 0) {
                    buffer.flip();
                    for (int i = 0; i < buffer.limit(); i++) {
                        out.write(buffer.get());
                    }
                    buffer.clear();
                }
            } catch (IOException e) {
                logger.error(e.getMessage(), e);
            }

            out.close();
            connection.getResponseCode();
            logger.info("HTTP response code is " + connection.getResponseCode());

        } catch (S3Exception | IOException e) {
            logger.error(e.getMessage(), e);
        }
    }
```

Use the JDK `HttpClient` (since v11) class to do the upload.

```
    /* Use the JDK HttpClient (since v11) class to do the upload. */
    public void useHttpClientToPut(String presignedUrlString, File fileToPut,
Map<String, String> metadata) {
        logger.info("Begin [{}] upload", fileToPut.toString());
```

```
        HttpRequest.Builder requestBuilder = HttpRequest.newBuilder();
        metadata.forEach((k, v) -> requestBuilder.header("x-amz-meta-" + k, v));

        HttpClient httpClient = HttpClient.newHttpClient();
        try {
            final HttpResponse<Void> response = httpClient.send(requestBuilder
                            .uri(new URL(presignedUrlString).toURI())

.PUT(HttpRequest.BodyPublishers.ofFile(Path.of(fileToPut.toURI())))
                            .build(),
                    HttpResponse.BodyHandlers.discarding());

            logger.info("HTTP response code is " + response.statusCode());

        } catch (URISyntaxException | InterruptedException | IOException e) {
            logger.error(e.getMessage(), e);
        }
    }
```

Use the AWS for Java V2 SdkHttpClient class to do the upload.

```
    /* Use the AWS SDK for Java V2 SdkHttpClient class to do the upload. */
    public void useSdkHttpClientToPut(String presignedUrlString, File fileToPut,
Map<String, String> metadata) {
        logger.info("Begin [{}] upload", fileToPut.toString());

                   .bucket(bucketName)
                   .key(keyName)
                   .overrideConfiguration(overrideConfigurationBuilder.build()) //
Add the override configuration.
                   .build();

           PutObjectPresignRequest presignRequest =
PutObjectPresignRequest.builder()
                   .signatureDuration(Duration.ofMinutes(10))  // The URL expires
in 10 minutes.
                   .putObjectRequest(objectRequest)
                   .build();

           PresignedPutObjectRequest presignedRequest =
presigner.presignPutObject(presignRequest);
           String myURL = presignedRequest.url().toString();
```

```
            logger.info("Presigned URL to upload a file to: [{}]", myURL);
            logger.info("HTTP method: [{}]",
presignedRequest.httpRequest().method());

            return presignedRequest.url().toExternalForm();
        }
    }
```

Use the AWS for Java V2 `SdkHttpClient` class to do the upload.

```
    /**
     * Use the AWS SDK for Java V2 SdkHttpClient class to execute the PUT request.
Since the
     * URL contains the query parameters, no headers are needed for metadata, SSE
settings, or ACL settings.
     *
     * @param presignedUrlString The URL for the PUT request.
     * @param fileToPut File to uplaod
     */
    public void useSdkHttpClientToPut(String presignedUrlString, File fileToPut) {
        logger.info("Begin [{}] upload", fileToPut.toString());

        try {
            URL presignedUrl = new URL(presignedUrlString);

            SdkHttpRequest.Builder requestBuilder = SdkHttpRequest.builder()
                    .method(SdkHttpMethod.PUT)
                    .uri(presignedUrl.toURI());

            SdkHttpRequest request = requestBuilder.build();

            HttpExecuteRequest executeRequest = HttpExecuteRequest.builder()
                    .request(request)
                    .contentStreamProvider(new
FileContentStreamProvider(fileToPut.toPath()))
                    .build();

            try (SdkHttpClient sdkHttpClient = ApacheHttpClient.create()) {
                HttpExecuteResponse response =
sdkHttpClient.prepareRequest(executeRequest).call();
                logger.info("Response code: {}",
response.httpResponse().statusCode());
```

```
            }
        } catch (URISyntaxException | IOException e) {
            logger.error(e.getMessage(), e);
        }
    }
```

Create a serverless application to manage photos

The following code example shows how to create a serverless application that lets users manage photos using labels.

SDK for Java 2.x

Shows how to develop a photo asset management application that detects labels in images using Amazon Rekognition and stores them for later retrieval.

For complete source code and instructions on how to set up and run, see the full example on GitHub.

For a deep dive into the origin of this example see the post on AWS Community.

Services used in this example

- API Gateway
- DynamoDB
- Lambda
- Amazon Rekognition
- Amazon S3
- Amazon SNS

Delete incomplete multipart uploads

The following code example shows how to how to delete or stop incomplete Amazon S3 multipart uploads.

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

To stop multipart uploads that are in-progress or incomplete for any reason, you can get a list uploads and then delete them as shown in the following example.

```
   /**
    * Aborts all incomplete multipart uploads from the specified S3 bucket.
    * <p>
    * This method retrieves a list of all incomplete multipart uploads in the
specified S3 bucket,
    * and then aborts each of those uploads.
    */
   public static void abortIncompleteMultipartUploadsFromList() {
       ListMultipartUploadsRequest listMultipartUploadsRequest =
ListMultipartUploadsRequest.builder()
           .bucket(bucketName)
           .build();

       ListMultipartUploadsResponse response =
s3Client.listMultipartUploads(listMultipartUploadsRequest);
       List<MultipartUpload> uploads = response.uploads();

       AbortMultipartUploadRequest abortMultipartUploadRequest;
       for (MultipartUpload upload : uploads) {
           abortMultipartUploadRequest = AbortMultipartUploadRequest.builder()
               .bucket(bucketName)
               .key(upload.key())
               .expectedBucketOwner(accountId)
               .uploadId(upload.uploadId())
               .build();

           AbortMultipartUploadResponse abortMultipartUploadResponse =
s3Client.abortMultipartUpload(abortMultipartUploadRequest);
           if (abortMultipartUploadResponse.sdkHttpResponse().isSuccessful()) {
               logger.info("Upload ID [{}] to bucket [{}] successfully aborted.",
upload.uploadId(), bucketName);
```

```
            }
        }
    }
```

To delete incomplete multipart uploads that were initiated before or after a date, you can selectively delete multipart uploads based on a point in time as shown in the following example.

```
    static void abortIncompleteMultipartUploadsOlderThan(Instant pointInTime) {
        ListMultipartUploadsRequest listMultipartUploadsRequest =
ListMultipartUploadsRequest.builder()
            .bucket(bucketName)
            .build();

        ListMultipartUploadsResponse response =
s3Client.listMultipartUploads(listMultipartUploadsRequest);
        List<MultipartUpload> uploads = response.uploads();

        AbortMultipartUploadRequest abortMultipartUploadRequest;
        for (MultipartUpload upload : uploads) {
            logger.info("Found multipartUpload with upload ID [{}], initiated [{}]",
upload.uploadId(), upload.initiated());
            if (upload.initiated().isBefore(pointInTime)) {
                abortMultipartUploadRequest = AbortMultipartUploadRequest.builder()
                    .bucket(bucketName)
                    .key(upload.key())
                    .expectedBucketOwner(accountId)
                    .uploadId(upload.uploadId())
                    .build();

                AbortMultipartUploadResponse abortMultipartUploadResponse =
s3Client.abortMultipartUpload(abortMultipartUploadRequest);
                if (abortMultipartUploadResponse.sdkHttpResponse().isSuccessful()) {
                    logger.info("Upload ID [{}] to bucket [{}] successfully
aborted.", upload.uploadId(), bucketName);
                }
            }
        }
    }
```

If you have access to the upload ID after you begin a multipart upload, you can delete the in-progress upload by using the ID.

```
   static void abortMultipartUploadUsingUploadId() {
       String uploadId = startUploadReturningUploadId();
       AbortMultipartUploadResponse response = s3Client.abortMultipartUpload(b -> b
           .uploadId(uploadId)
           .bucket(bucketName)
           .key(key));

       if (response.sdkHttpResponse().isSuccessful()) {
           logger.info("Upload ID [{}] to bucket [{}] successfully aborted.",
uploadId, bucketName);
       }
   }
```

To consistently delete incomplete multipart uploads older that a certain number of days, set up a bucket lifecycle configuration for the bucket. The following example shows how to create a rule to delete incomplete uploads older than 7 days.

```
   static void abortMultipartUploadsUsingLifecycleConfig() {
       Collection<LifecycleRule> lifeCycleRules = List.of(LifecycleRule.builder()
           .abortIncompleteMultipartUpload(b -> b.
               daysAfterInitiation(7))
           .status("Enabled")
           .filter(SdkBuilder::build) // Filter element is required.
           .build());

       // If the action is successful, the service sends back an HTTP 200 response
with an empty HTTP body.
       PutBucketLifecycleConfigurationResponse response =
s3Client.putBucketLifecycleConfiguration(b -> b
           .bucket(bucketName)
           .lifecycleConfiguration(b1 -> b1.rules(lifeCycleRules)));

       if (response.sdkHttpResponse().isSuccessful()) {
           logger.info("Rule to abort incomplete multipart uploads added to
bucket.");
       } else {
           logger.error("Unsuccessfully applied rule. HTTP status code is [{}]",
response.sdkHttpResponse().statusCode());
       }
```

```
    }
```

Detect PPE in images

The following code example shows how to build an app that uses Amazon Rekognition to detect Personal Protective Equipment (PPE) in images.

SDK for Java 2.x

Shows how to create an AWS Lambda function that detects images with Personal Protective Equipment.

For complete source code and instructions on how to set up and run, see the full example on GitHub.

Services used in this example

- DynamoDB
- Amazon Rekognition
- Amazon S3
- Amazon SES

Detect objects in images

The following code example shows how to build an app that uses Amazon Rekognition to detect objects by category in images.

SDK for Java 2.x

Shows how to use Amazon Rekognition Java API to create an app that uses Amazon Rekognition to identify objects by category in images located in an Amazon Simple Storage Service (Amazon S3) bucket. The app sends the admin an email notification with the results using Amazon Simple Email Service (Amazon SES).

For complete source code and instructions on how to set up and run, see the full example on GitHub.

Services used in this example

- Amazon Rekognition
- Amazon S3
- Amazon SES

Detect people and objects in a video

The following code example shows how to detect people and objects in a video with Amazon Rekognition.

SDK for Java 2.x

Shows how to use Amazon Rekognition Java API to create an app to detect faces and objects in videos located in an Amazon Simple Storage Service (Amazon S3) bucket. The app sends the admin an email notification with the results using Amazon Simple Email Service (Amazon SES).

For complete source code and instructions on how to set up and run, see the full example on GitHub.

Services used in this example

- Amazon Rekognition
- Amazon S3
- Amazon SES
- Amazon SNS
- Amazon SQS

Download S3 'directories'

The following code example shows how to download and filter the contents of Amazon S3 bucket 'directories'.

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

This example show how to use the S3TransferManager in the AWS SDK for Java 2.x to download 'directories' from an Amazon S3 bucket. It also demonstrates how to use DownloadFilters in the request.

```
   /**
    * For standard buckets, S3 provides the illusion of a directory structure
through the use of keys. When you upload
    * an object to an S3 bucket, you specify a key, which is essentially the "path"
to the object. The key can contain
    * forward slashes ("/") to make it appear as if the object is stored in a
directory structure, but this is just a
    * logical representation, not an actual directory.
    * <p><pre>
    * In this example, our S3 bucket contains the following objects:
    *
    * folder1/file1.txt
    * folder1/file2.txt
    * folder1/file3.txt
    * folder2/file1.txt
    * folder2/file2.txt
    * folder2/file3.txt
    * folder3/file1.txt
    * folder3/file2.txt
    * folder3/file3.txt
    *
    * When method `downloadS3Directories` is invoked with
    * `destinationPathURI` set to `/test`, the downloaded
    * directory looks like:
    *
    * |- test
    *    |- folder1
    *       |- file1.txt
    *       |- file2.txt
    *       |- file3.txt
```

```
     *    |- folder3
     *       |- file1.txt
     *       |- file2.txt
     *       |- file3.txt
     * </pre>
     *
     * @param transferManager    An S3TransferManager instance.
     * @param destinationPathURI local directory to hold the downloaded S3
'directories' and files.
     * @param bucketName         The S3 bucket that contains the 'directories' to
download.
     * @return The number of objects (files, in this case) that were downloaded.
     */
    public Integer downloadS3Directories(S3TransferManager transferManager,
                                         URI destinationPathURI, String bucketName)
{

        // Define the filters for which 'directories' we want to download.
        DownloadFilter folder1Filter = (S3Object s3Object) ->
s3Object.key().startsWith("folder1/");
        DownloadFilter folder3Filter = (S3Object s3Object) ->
s3Object.key().startsWith("folder3/");
        DownloadFilter folderFilter = s3Object ->
folder1Filter.or(folder3Filter).test(s3Object);

        DirectoryDownload directoryDownload =
transferManager.downloadDirectory(DownloadDirectoryRequest.builder()
                .destination(Paths.get(destinationPathURI))
                .bucket(bucketName)
                .filter(folderFilter)
                .build());
        CompletedDirectoryDownload completedDirectoryDownload =
directoryDownload.completionFuture().join();

import java.util.stream.Collectors;

    public Integer downloadObjectsToDirectory(S3TransferManager transferManager,
            URI destinationPathURI, String bucketName) {
        DirectoryDownload directoryDownload =
 transferManager.downloadDirectory(DownloadDirectoryRequest.builder()
                .destination(Paths.get(destinationPathURI))
                .bucket(bucketName)
                .build());
        CompletedDirectoryDownload completedDirectoryDownload =
 directoryDownload.completionFuture().join();

        completedDirectoryDownload.failedTransfers()
                .forEach(fail -> logger.warn("Object [{}] failed to transfer",
 fail.toString()));
        return completedDirectoryDownload.failedTransfers().size();
    }
```

- For API details, see DownloadDirectory in *AWS SDK for Java 2.x API Reference*.

Lock Amazon S3 objects

The following code example shows how to work with S3 object lock features.

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Run an interactive scenario demonstrating Amazon S3 object lock features.

```
import software.amazon.awssdk.services.s3.model.ObjectLockLegalHold;
```

```
import software.amazon.awssdk.services.s3.model.ObjectLockRetention;
import java.io.BufferedWriter;
import java.io.IOException;
import java.util.ArrayList;
import java.util.List;
import java.util.Scanner;
import java.util.stream.Collectors;

/*
 Before running this Java V2 code example, set up your development
 environment, including your credentials.

 For more information, see the following documentation topic:
 https://docs.aws.amazon.com/sdk-for-java/latest/developer-guide/setup.html

 This Java example performs the following tasks:
    1. Create test Amazon Simple Storage Service (S3) buckets with different lock
 policies.
    2. Upload sample objects to each bucket.
    3. Set some Legal Hold and Retention Periods on objects and buckets.
    4. Investigate lock policies by viewing settings or attempting to delete or
 overwrite objects.
    5. Clean up objects and buckets.
 */

Process S3 event notifications

The following code example shows how to work with S3 event notifications in an object-oriented way.

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

This example show how to process S3 notification event by using Amazon SQS.

```
    /**
     * This method receives S3 event notifications by using an SqsAsyncClient.
     * After the client receives the messages it deserializes the JSON payload and
logs them. It uses
     * the S3EventNotification class (part of the S3 event notification API for
Java) to deserialize
     * the JSON payload and access the messages in an object-oriented way.
     *
     * @param queueUrl The URL of the AWS SQS queue that receives the S3 event
notifications.
```

```
     * @see <a href="https://sdk.amazonaws.com/java/api/latest/software/amazon/
awssdk/eventnotifications/s3/model/package-summary.html">S3EventNotification API</
a>.
     * <p>
     * To use S3 event notification serialization/deserialization to objects, add
 the following
     * dependency to your Maven pom.xml file.
     * <dependency>
     * <groupId>software.amazon.awssdk</groupId>
     * <artifactId>s3-event-notifications</artifactId>
     * <version><LATEST></version>
     * </dependency>
     * <p>
     * The S3 event notification API became available with version 2.25.11 of the
 Java SDK.
     * <p>
     * This example shows the use of the API with AWS SQS, but it can be used to
 process S3 event notifications
     * in AWS SNS or AWS Lambda as well.
     * <p>
     * Note: The S3EventNotification class does not work with messages routed
 through AWS EventBridge.
     */
    static void processS3Events(String bucketName, String queueUrl, String queueArn)

Send event notifications to EventBridge

The following code example shows how to enable a bucket to send S3 event notifications to EventBridge and route notifications to an Amazon SNS topic and Amazon SQS queue.

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
   /** This method configures a bucket to send events to AWS EventBridge and
creates a rule
```

```
     * to route the S3 object created events to a topic and a queue.
     *
     * @param bucketName Name of existing bucket
     * @param topicArn ARN of existing topic to receive S3 event notifications
     * @param queueArn ARN of existing queue to receive S3 event notifications
     *
     *  An AWS CloudFormation stack sets up the bucket, queue, topic before the
method runs.
     */
   public static String setBucketNotificationToEventBridge(String bucketName,
String topicArn, String queueArn) {
       try {
           // Enable bucket to emit S3 Event notifications to EventBridge.
           s3Client.putBucketNotificationConfiguration(b -> b
                   .bucket(bucketName)
                   .notificationConfiguration(b1 -> b1
                           .eventBridgeConfiguration(
                                   SdkBuilder::build)
                   ).build()).join();

           // Create an EventBridge rule to route Object Created notifications.
           PutRuleRequest putRuleRequest = PutRuleRequest.builder()
                   .name(RULE_NAME)
                   .eventPattern("""
                           {
                             "source": ["aws.s3"],

Track uploads and downloads

The following code example shows how to track an Amazon S3 object upload or download.

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Track the progress of a file upload.

```
   public void trackUploadFile(S3TransferManager transferManager, String
bucketName,
                               String key, URI filePathURI) {
       UploadFileRequest uploadFileRequest = UploadFileRequest.builder()
               .putObjectRequest(b -> b.bucket(bucketName).key(key))
               .addTransferListener(LoggingTransferListener.create())  // Add
listener.
               .source(Paths.get(filePathURI))
               .build();

       FileUpload fileUpload = transferManager.uploadFile(uploadFileRequest);

       fileUpload.completionFuture().join();
       /*
           The SDK provides a LoggingTransferListener implementation of the
TransferListener interface.
           You can also implement the interface to provide your own logic.

           Configure log4J2 with settings such as the following.
               <Configuration status="WARN">
                   <Appenders>
                       <Console name="AlignedConsoleAppender" target="SYSTEM_OUT">
                           <PatternLayout pattern="%m%n"/>
                       </Console>
                   </Appenders>

                   <Loggers>
                       <logger
name="software.amazon.awssdk.transfer.s3.progress.LoggingTransferListener"
level="INFO" additivity="false">
                           <AppenderRef ref="AlignedConsoleAppender"/>
                       </logger>
                   </Loggers>
```

```
                </Configuration>

            Log4J2 logs the progress. The following is example output for a 21.3 MB
file upload.
                Transfer initiated...
                |                    | 0.0%
                |====                | 21.1%
                |============        | 60.5%
                |====================| 100.0%
                Transfer complete!
        */
    }
```

Track the progress of a file download.

```
    public void trackDownloadFile(S3TransferManager transferManager, String
bucketName,
                              String key, String downloadedFileWithPath) {
        DownloadFileRequest downloadFileRequest = DownloadFileRequest.builder()
                .getObjectRequest(b -> b.bucket(bucketName).key(key))
                .addTransferListener(LoggingTransferListener.create())  // Add
listener.
                .destination(Paths.get(downloadedFileWithPath))
                .build();

        FileDownload downloadFile =
transferManager.downloadFile(downloadFileRequest);

        CompletedFileDownload downloadResult =
downloadFile.completionFuture().join();
        /*
            The SDK provides a LoggingTransferListener implementation of the
TransferListener interface.
            You can also implement the interface to provide your own logic.

            Configure log4J2 with settings such as the following.
                <Configuration status="WARN">
                    <Appenders>
                        <Console name="AlignedConsoleAppender" target="SYSTEM_OUT">
                            <PatternLayout pattern="%m%n"/>
                        </Console>
                    </Appenders>
```

```
                    <Loggers>
                        <logger
name="software.amazon.awssdk.transfer.s3.progress.LoggingTransferListener"
level="INFO" additivity="false">
                            <AppenderRef ref="AlignedConsoleAppender"/>
                        </logger>
                    </Loggers>
                </Configuration>

            Log4J2 logs the progress. The following is example output for a 21.3 MB
file download.
                Transfer initiated...
                |=======             | 39.4%
                |===============     | 78.8%
                |====================| 100.0%
                Transfer complete!
        */
    }
```

  - GetObject
  - PutObject

Upload directory to a bucket

The following code example shows how to upload a local directory recursively to an Amazon Simple Storage Service (Amazon S3) bucket.

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Use an S3TransferManager to upload a local directory. View the complete file and test.

```
import org.slf4j.Logger;
```

```
import org.slf4j.LoggerFactory;
import software.amazon.awssdk.services.s3.model.ObjectIdentifier;
import software.amazon.awssdk.transfer.s3.S3TransferManager;
import software.amazon.awssdk.transfer.s3.model.CompletedDirectoryUpload;
import software.amazon.awssdk.transfer.s3.model.DirectoryUpload;
import software.amazon.awssdk.transfer.s3.model.UploadDirectoryRequest;

import java.net.URI;
import java.net.URISyntaxException;
import java.net.URL;
import java.nio.file.Paths;
import java.util.UUID;

    public Integer uploadDirectory(S3TransferManager transferManager,
            URI sourceDirectory, String bucketName) {
        DirectoryUpload directoryUpload =
 transferManager.uploadDirectory(UploadDirectoryRequest.builder()
                .source(Paths.get(sourceDirectory))
                .bucket(bucketName)
                .build());

        CompletedDirectoryUpload completedDirectoryUpload =
 directoryUpload.completionFuture().join();
        completedDirectoryUpload.failedTransfers()
                .forEach(fail -> logger.warn("Object [{}] failed to transfer",
 fail.toString()));
        return completedDirectoryUpload.failedTransfers().size();
    }
```

- For API details, see UploadDirectory in *AWS SDK for Java 2.x API Reference*.

Upload or download large files

The following code example shows how to upload or download large files to and from Amazon S3.

For more information, see Uploading an object using multipart upload.

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Call functions that transfer files to and from an S3 bucket using the S3TransferManager.

```
   public Integer downloadObjectsToDirectory(S3TransferManager transferManager,
           URI destinationPathURI, String bucketName) {
       DirectoryDownload directoryDownload =
transferManager.downloadDirectory(DownloadDirectoryRequest.builder()
               .destination(Paths.get(destinationPathURI))
               .bucket(bucketName)
               .build());
       CompletedDirectoryDownload completedDirectoryDownload =
directoryDownload.completionFuture().join();

       completedDirectoryDownload.failedTransfers()
               .forEach(fail -> logger.warn("Object [{}] failed to transfer",
fail.toString()));
       return completedDirectoryDownload.failedTransfers().size();
   }
```

Upload an entire local directory.

```
   public Integer uploadDirectory(S3TransferManager transferManager,
           URI sourceDirectory, String bucketName) {
       DirectoryUpload directoryUpload =
transferManager.uploadDirectory(UploadDirectoryRequest.builder()
               .source(Paths.get(sourceDirectory))
               .bucket(bucketName)
               .build());

       CompletedDirectoryUpload completedDirectoryUpload =
directoryUpload.completionFuture().join();
       completedDirectoryUpload.failedTransfers()
               .forEach(fail -> logger.warn("Object [{}] failed to transfer",
fail.toString()));
```

```
        return completedDirectoryUpload.failedTransfers().size();
    }
```

Upload a single file.

```
    public String uploadFile(S3TransferManager transferManager, String bucketName,
                             String key, URI filePathURI) {
        UploadFileRequest uploadFileRequest = UploadFileRequest.builder()
            .putObjectRequest(b -> b.bucket(bucketName).key(key))
            .source(Paths.get(filePathURI))
            .build();

        FileUpload fileUpload = transferManager.uploadFile(uploadFileRequest);

        CompletedFileUpload uploadResult = fileUpload.completionFuture().join();
        return uploadResult.response().eTag();
    }
```

The code examples use the following imports.

```
import org.slf4j.Logger;
import org.slf4j.LoggerFactory;
import software.amazon.awssdk.core.exception.SdkException;
import software.amazon.awssdk.core.sync.RequestBody;
import software.amazon.awssdk.services.s3.S3AsyncClient;
import software.amazon.awssdk.services.s3.S3Client;
import software.amazon.awssdk.services.s3.model.CompletedMultipartUpload;
import software.amazon.awssdk.services.s3.model.CompletedPart;
import software.amazon.awssdk.services.s3.model.CreateMultipartUploadResponse;
import software.amazon.awssdk.services.s3.model.PutObjectResponse;
import software.amazon.awssdk.services.s3.model.UploadPartRequest;
import software.amazon.awssdk.services.s3.model.UploadPartResponse;
import software.amazon.awssdk.services.s3.waiters.S3Waiter;
import software.amazon.awssdk.transfer.s3.S3TransferManager;
import software.amazon.awssdk.transfer.s3.model.FileUpload;
import software.amazon.awssdk.transfer.s3.model.UploadFileRequest;

import java.io.IOException;
import java.io.RandomAccessFile;
import java.net.URISyntaxException;
```

```
import java.net.URL;
import java.nio.ByteBuffer;
import java.nio.file.Paths;
import java.util.ArrayList;
import java.util.List;
import java.util.Objects;
import java.util.UUID;
import java.util.concurrent.CompletableFuture;
```

Use the S3 Transfer Manager on top of the AWS CRT-based S3 client to transparently perform a multipart upload when the size of the content exceeds a threshold. The default threshold size is 8 MB.

```
    /**
     * Uploads a file to an Amazon S3 bucket using the S3TransferManager.
     *
     * @param filePath the file path of the file to be uploaded
     */
    public void multipartUploadWithTransferManager(String filePath) {
        S3TransferManager transferManager = S3TransferManager.create();
        UploadFileRequest uploadFileRequest = UploadFileRequest.builder()
            .putObjectRequest(b -> b
                .bucket(bucketName)
                .key(key))
            .source(Paths.get(filePath))
            .build();
        FileUpload fileUpload = transferManager.uploadFile(uploadFileRequest);
        fileUpload.completionFuture().join();
        transferManager.close();
    }
```

Use the S3Client API to perform a multipart upload.

```
    /**
     * Performs a multipart upload to Amazon S3 using the provided S3 client.
     *
     * @param filePath the path to the file to be uploaded
     */
    public void multipartUploadWithS3Client(String filePath) {

        // Initiate the multipart upload.
```

```
        CreateMultipartUploadResponse createMultipartUploadResponse =
s3Client.createMultipartUpload(b -> b
            .bucket(bucketName)
            .key(key));
        String uploadId = createMultipartUploadResponse.uploadId();

        // Upload the parts of the file.
        int partNumber = 1;
        List<CompletedPart> completedParts = new ArrayList<>();
        ByteBuffer bb = ByteBuffer.allocate(1024 * 1024 * 5); // 5 MB byte buffer

        try (RandomAccessFile file = new RandomAccessFile(filePath, "r")) {
            long fileSize = file.length();
            long position = 0;
            while (position < fileSize) {
                file.seek(position);
                long read = file.getChannel().read(bb);

                bb.flip(); // Swap position and limit before reading from the
buffer.
                UploadPartRequest uploadPartRequest = UploadPartRequest.builder()
                    .bucket(bucketName)
                    .key(key)
                    .uploadId(uploadId)
                    .partNumber(partNumber)
                    .build();

                UploadPartResponse partResponse = s3Client.uploadPart(
                    uploadPartRequest,
                    RequestBody.fromByteBuffer(bb));

                CompletedPart part = CompletedPart.builder()
                    .partNumber(partNumber)
                    .eTag(partResponse.eTag())
                    .build();
                completedParts.add(part);

                bb.clear();
                position += read;
                partNumber++;
            }
        } catch (IOException e) {
            logger.error(e.getMessage());
        }
```

```
        // Complete the multipart upload.
        s3Client.completeMultipartUpload(b -> b
            .bucket(bucketName)
            .key(key)
            .uploadId(uploadId)

.multipartUpload(CompletedMultipartUpload.builder().parts(completedParts).build()));
    }
```

Use the S3AsyncClient API with multipart support enabled to perform a multipart upload.

```
    /**
     * Uploads a file to an S3 bucket using the S3AsyncClient and enabling multipart
support.
     *
     * @param filePath the local file path of the file to be uploaded
     */
    public void multipartUploadWithS3AsyncClient(String filePath) {
        // Enable multipart support.
        S3AsyncClient s3AsyncClient = S3AsyncClient.builder()
            .multipartEnabled(true)
            .build();

        CompletableFuture<PutObjectResponse> response = s3AsyncClient.putObject(b ->
b
                .bucket(bucketName)
                .key(key),
            Paths.get(filePath));

        response.join();
        logger.info("File uploaded in multiple 8 MiB parts using S3AsyncClient.");
    }
```

Upload stream of unknown size

The following code example shows how to upload a stream of unknown size to an Amazon S3 object.

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Use the AWS CRT-based S3 Client.

```

```
     * @param bucketName - The name of the bucket.
     * @param key - The name of the object.
     * @return - software.amazon.awssdk.transfer.s3.model.CompletedUpload - The
 result of the completed upload.
     */
    public CompletedUpload uploadStream(S3TransferManager transferManager, String
 bucketName, String key) {

        // AsyncExampleUtils.randomString() returns a random string up to 100
 characters.
        String randomString = AsyncExampleUtils.randomString();
        logger.info("random string to upload: {}: length={}", randomString,
 randomString.length());
        InputStream inputStream = new ByteArrayInputStream(randomString.getBytes());

        // Executor required to handle reading from the InputStream on a separate
 thread so the main upload is not blocked.
        ExecutorService executor = Executors.newSingleThreadExecutor();
        // Specify `null` for the content length when you don't know the content
 length.
        AsyncRequestBody body = AsyncRequestBody.fromInputStream(inputStream, null,
 executor);

        Upload upload = transferManager.upload(builder -> builder
                .requestBody(body)
                .putObjectRequest(req -> req.bucket(bucketName).key(key))
                .build());

        CompletedUpload completedUpload = upload.completionFuture().join();
        executor.shutdown();
        return completedUpload;
    }
}
```

Use checksums

The following code example shows how to use checksums to work with an Amazon S3 object.

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

The code examples use a subset of the following imports.

```
import org.slf4j.Logger;
import org.slf4j.LoggerFactory;
import software.amazon.awssdk.core.exception.SdkException;
import software.amazon.awssdk.core.sync.RequestBody;
import software.amazon.awssdk.services.s3.S3Client;
import software.amazon.awssdk.services.s3.model.ChecksumAlgorithm;
import software.amazon.awssdk.services.s3.model.ChecksumMode;
import software.amazon.awssdk.services.s3.model.CompletedMultipartUpload;
import software.amazon.awssdk.services.s3.model.CompletedPart;
import software.amazon.awssdk.services.s3.model.CreateMultipartUploadResponse;
import software.amazon.awssdk.services.s3.model.GetObjectResponse;
import software.amazon.awssdk.services.s3.model.UploadPartRequest;
import software.amazon.awssdk.services.s3.model.UploadPartResponse;
import software.amazon.awssdk.services.s3.waiters.S3Waiter;
import software.amazon.awssdk.transfer.s3.S3TransferManager;
import software.amazon.awssdk.transfer.s3.model.FileUpload;
import software.amazon.awssdk.transfer.s3.model.UploadFileRequest;

import java.io.FileInputStream;
import java.io.IOException;
import java.io.RandomAccessFile;
import java.net.URISyntaxException;
import java.net.URL;
import java.nio.ByteBuffer;
import java.nio.file.Paths;
import java.security.DigestInputStream;
import java.security.MessageDigest;
import java.security.NoSuchAlgorithmException;
import java.util.ArrayList;
import java.util.Base64;
import java.util.List;
import java.util.Objects;
```

```
import java.util.UUID;
```

Specify a checksum algorithm for the `putObject` method when you build the `PutObjectRequest`.

```
    public void putObjectWithChecksum() {
        s3Client.putObject(b -> b
                .bucket(bucketName)
                .key(key)
                .checksumAlgorithm(ChecksumAlgorithm.CRC32),
            RequestBody.fromString("This is a test"));
    }
```

Verify the checksum for the `getObject` method when you build the GetObjectRequest.

```
    public GetObjectResponse getObjectWithChecksum() {
        return s3Client.getObject(b -> b
                .bucket(bucketName)
                .key(key)
                .checksumMode(ChecksumMode.ENABLED))
            .response();
    }
```

Pre-calculate a checksum for the `putObject` method when you build the `PutObjectRequest`.

```
    public void putObjectWithPrecalculatedChecksum(String filePath) {
        String checksum = calculateChecksum(filePath, "SHA-256");

        s3Client.putObject((b -> b
                .bucket(bucketName)
                .key(key)
                .checksumSHA256(checksum)),
            RequestBody.fromFile(Paths.get(filePath)));
    }
```

Use the S3 Transfer Manager on top of the AWS CRT-based S3 client to transparently perform a multipart upload when the size of the content exceeds a threshold. The default threshold size is 8 MB.

You can specify a checksum algorithm for the SDK to use. By default, the SDK uses the CRC32 algorithm.

```
    public void multipartUploadWithChecksumTm(String filePath) {
        S3TransferManager transferManager = S3TransferManager.create();
        UploadFileRequest uploadFileRequest = UploadFileRequest.builder()
            .putObjectRequest(b -> b
                .bucket(bucketName)
                .key(key)
                .checksumAlgorithm(ChecksumAlgorithm.SHA1))
            .source(Paths.get(filePath))
            .build();
        FileUpload fileUpload = transferManager.uploadFile(uploadFileRequest);
        fileUpload.completionFuture().join();
        transferManager.close();
    }
```

Use the S3Client API or (S3AsyncClient API) to perform a multipart upload. If you specify an additional checksum, you must specify the algorithm to use on the initiation of the upload. You must also specify the algorithm for each part request and provide the checksum calculated for each part after it is uploaded.

```
    public void multipartUploadWithChecksumS3Client(String filePath) {
        ChecksumAlgorithm algorithm = ChecksumAlgorithm.CRC32;

        // Initiate the multipart upload.
        CreateMultipartUploadResponse createMultipartUploadResponse =
s3Client.createMultipartUpload(b -> b
            .bucket(bucketName)
            .key(key)
            .checksumAlgorithm(algorithm)); // Checksum specified on initiation.
        String uploadId = createMultipartUploadResponse.uploadId();

        // Upload the parts of the file.
        int partNumber = 1;
        List<CompletedPart> completedParts = new ArrayList<>();
        ByteBuffer bb = ByteBuffer.allocate(1024 * 1024 * 5); // 5 MB byte buffer
```

```
        try (RandomAccessFile file = new RandomAccessFile(filePath, "r")) {
            long fileSize = file.length();
            long position = 0;
            while (position < fileSize) {
                file.seek(position);
                long read = file.getChannel().read(bb);

                bb.flip(); // Swap position and limit before reading from the
buffer.
                UploadPartRequest uploadPartRequest = UploadPartRequest.builder()
                    .bucket(bucketName)
                    .key(key)
                    .uploadId(uploadId)
                    .checksumAlgorithm(algorithm) // Checksum specified on each
part.
                    .partNumber(partNumber)
                    .build();

                UploadPartResponse partResponse = s3Client.uploadPart(
                    uploadPartRequest,
                    RequestBody.fromByteBuffer(bb));

                CompletedPart part = CompletedPart.builder()
                    .partNumber(partNumber)
                    .checksumCRC32(partResponse.checksumCRC32()) // Provide the
calculated checksum.
                    .eTag(partResponse.eTag())
                    .build();
                completedParts.add(part);

                bb.clear();
                position += read;
                partNumber++;
            }
        } catch (IOException e) {
            System.err.println(e.getMessage());
        }

        // Complete the multipart upload.
        s3Client.completeMultipartUpload(b -> b
            .bucket(bucketName)
            .key(key)
            .uploadId(uploadId)
```

```
.multipartUpload(CompletedMultipartUpload.builder().parts(completedParts).build()));
    }
```

- For API details, see the following topics in *AWS SDK for Java 2.x API Reference*.

  - CreateMultipartUpload
  - UploadPart

Serverless examples

Invoke a Lambda function from an Amazon S3 trigger

The following code example shows how to implement a Lambda function that receives an event triggered by uploading an object to an S3 bucket. The function retrieves the S3 bucket name and object key from the event parameter and calls the Amazon S3 API to retrieve and log the content type of the object.

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Serverless examples repository.

Consuming an S3 event with Lambda using Java.

```

Amazon S3 Control examples using SDK for Java 2.x

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Java 2.x with Amazon S3 Control.

Basics are code examples that show you how to perform the essential operations within a service.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Get started

Hello Amazon S3 Control

The following code example shows how to get started using Amazon S3 Control.

SDK for Java 2.x

    public static final String DASHES = new String(new char[80]).replace("\0", "-");
    private static final String STACK_NAME = "MyS3Stack";
    public static void main(String[] args) throws IOException {
        S3BatchActions actions = new S3BatchActions();
        String accountId = actions.getAccountId();
        String uuid = java.util.UUID.randomUUID().toString();
        Scanner scanner = new Scanner(System.in);

        System.out.println(DASHES);
        System.out.println("Welcome to the Amazon S3 Batch basics scenario.");
        System.out.println("""
            S3 Batch operations enables efficient and cost-effective processing of
 large-scale
            data stored in Amazon S3. It automatically scales resources to handle
 varying workloads
            without the need for manual intervention.

            One of the key features of S3 Batch is its ability to perform tagging
 operations on objects stored in
            S3 buckets. Users can leverage S3 Batch to apply, update, or remove tags
 on thousands or millions of
            objects in a single operation, streamlining the management and
 organization of their data.

            This can be particularly useful for tasks such as cost allocation,
 lifecycle management, or
            metadata-driven workflows, where consistent and accurate tagging is
 essential.
            S3 Batch's scalability and serverless nature make it an ideal solution
 for organizations with
            growing data volumes and complex data management requirements.
```

```
            This Java program walks you through Amazon S3 Batch operations.

            Let's get started...

priority");
        System.out.println("""
             In this step, we modify the job priority value. The higher the number,
the higher the priority.
             So, a job with a priority of `30` would have a higher priority than a
job with
             a priority of `20`. This is a common way to represent the priority of a
task
             or job, with higher numbers indicating a higher priority.

             Ensure that the job status allows for priority updates. Jobs in
certain
             states (e.g., Cancelled, Failed, or Completed) cannot have their
priorities
             updated. Only jobs in the Active or Suspended state typically allow
priority
             updates.

Actions

`CreateJob`

The following code example shows how to use `CreateJob`.

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Create an asynchronous S3 job.

```
    /**
     * Creates an asynchronous S3 job using the AWS Java SDK.
     *
     * @param accountId         the AWS account ID associated with the job
     * @param iamRoleArn        the ARN of the IAM role to be used for the job
     * @param manifestLocation  the location of the job manifest file in S3
     * @param reportBucketName  the name of the S3 bucket to store the job report
     * @param uuid              a unique identifier for the job
     * @return a CompletableFuture that represents the asynchronous creation of the
 S3 job.
     *         The CompletableFuture will return the job ID if the job is created
 successfully,
     *         or throw an exception if there is an error.
     */

            });
    }
```

- For API details, see UpdateJobStatus in *AWS SDK for Java 2.x API Reference*.

S3 Directory Buckets examples using SDK for Java 2.x

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Java 2.x with S3 Directory Buckets.

Basics are code examples that show you how to perform the essential operations within a service.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Scenarios are code examples that show you how to accomplish specific tasks by calling multiple functions within a service or combined with other AWS services.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Get started

Hello Amazon S3 directory buckets

The following code example shows how to get started using Amazon S3 directory buckets.

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
package com.example.s3.directorybucket;

import org.slf4j.Logger;
import org.slf4j.LoggerFactory;
import software.amazon.awssdk.regions.Region;
import software.amazon.awssdk.services.s3.S3Client;
import software.amazon.awssdk.services.s3.model.Bucket;
import software.amazon.awssdk.services.s3.model.BucketInfo;
import software.amazon.awssdk.services.s3.model.BucketType;
import software.amazon.awssdk.services.s3.model.CreateBucketConfiguration;
import software.amazon.awssdk.services.s3.model.CreateBucketRequest;
import software.amazon.awssdk.services.s3.model.CreateBucketResponse;
import software.amazon.awssdk.services.s3.model.DataRedundancy;
import software.amazon.awssdk.services.s3.model.DeleteBucketRequest;
import software.amazon.awssdk.services.s3.model.ListDirectoryBucketsRequest;
import software.amazon.awssdk.services.s3.model.ListDirectoryBucketsResponse;
import software.amazon.awssdk.services.s3.model.LocationInfo;
import software.amazon.awssdk.services.s3.model.LocationType;
import software.amazon.awssdk.services.s3.model.S3Exception;

import java.util.List;
import java.util.stream.Collectors;

import static com.example.s3.util.S3DirectoryBucketUtils.createS3Client;

/**
 * Before running this example:
 * <p>
 * The SDK must be able to authenticate AWS requests on your behalf. If you have
 * not configured
 * authentication for SDKs and tools, see
 * https://docs.aws.amazon.com/sdkref/latest/guide/access.html in the AWS SDKs
```

```
 * and Tools Reference Guide.
 * <p>
 * You must have a runtime environment configured with the Java SDK.
 * See
 * https://docs.aws.amazon.com/sdk-for-java/latest/developer-guide/setup.html in
 * the Developer Guide if this is not set up.
 * <p>
 * To use S3 directory buckets, configure a gateway VPC endpoint. This is the
 * recommended method to enable directory bucket traffic without
 * requiring an internet gateway or NAT device. For more information on
 * configuring VPC gateway endpoints, visit
 * https://docs.aws.amazon.com/AmazonS3/latest/userguide/s3-express-
networking.html#s3-express-networking-vpc-gateway.
 * <p>
 * Directory buckets are available in specific AWS Regions and Zones. For
 * details on Regions and Zones supporting directory buckets, see
 * https://docs.aws.amazon.com/AmazonS3/latest/userguide/s3-express-
networking.html#s3-express-endpoints.
 */

  - ListDirectoryBuckets

Topics

- Basics
- Actions
- Scenarios

Basics

Learn the basics

The following code example shows how to:

- Set up a VPC and VPC Endpoint.

- Set up the Policies, Roles, and User to work with S3 directory buckets and the S3 Express One Zone storage class.
- Create two S3 Clients.
- Create two buckets.
- Create an object and copy it over.
- Demonstrate performance difference.
- Populate the buckets to show the lexicographical difference.
- Prompt the user to see if they want to clean up the resources.

SDK for Java 2.x

            7. Populate the buckets to show the lexicographical (alphabetical)
difference
            when object names are listed. Now let's explore how directory buckets
store
            objects in a different manner to regular buckets. The key is in the
name
            "Directory". Where regular buckets store their key/value pairs in a
            flat manner, directory buckets use actual directories/folders.
            This allows for more rapid indexing, traversing, and therefore
            retrieval times!

            The more segmented your bucket is, with lots of
            directories, sub-directories, and objects, the more efficient it
becomes.
            This structural difference also causes `ListObject` operations to
behave
            differently, which can cause unexpected results. Let's add a few more
            objects in sub-directories to see how the output of
            ListObjects changes.
            """);

S3 Glacier examples using SDK for Java 2.x

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Java 2.x with S3 Glacier.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`CreateVault`

The following code example shows how to use `CreateVault`.

SDK for Java 2.x

SageMaker AI examples using SDK for Java 2.x

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Java 2.x with SageMaker AI.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Scenarios are code examples that show you how to accomplish specific tasks by calling multiple functions within a service or combined with other AWS services.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Get started

Hello SageMaker AI

The following code examples show how to get started using SageMaker AI.

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
/**
 * Before running this Java V2 code example, set up your development
 * environment, including your credentials.
 *
 * For more information, see the following documentation topic:
 *
 * https://docs.aws.amazon.com/sdk-for-java/latest/developer-guide/get-started.html
 */
public class HelloSageMaker {
    public static void main(String[] args) {
        Region region = Region.US_WEST_2;
        SageMakerClient sageMakerClient = SageMakerClient.builder()
                .region(region)
                .build();

        listBooks(sageMakerClient);
        sageMakerClient.close();
    }

    public static void listBooks(SageMakerClient sageMakerClient) {
        try {
            ListNotebookInstancesResponse notebookInstancesResponse =
 sageMakerClient.listNotebookInstances();
            List<NotebookInstanceSummary> items =
 notebookInstancesResponse.notebookInstances();
            for (NotebookInstanceSummary item : items) {
                System.out.println("The notebook name is: " +
 item.notebookInstanceName());
            }

        } catch (SageMakerException e) {
            System.err.println(e.awsErrorDetails().errorMessage());
            System.exit(1);
        }
```

```
    }
}
```

Actions

`CreatePipeline`

The following code example shows how to use `CreatePipeline`.

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
   // Create a pipeline from the example pipeline JSON.
   public static void setupPipeline(SageMakerClient sageMakerClient, String
filePath, String roleArn,
           String functionArn, String pipelineName) {
       System.out.println("Setting up the pipeline.");
       JSONParser parser = new JSONParser();

       // Read JSON and get pipeline definition.
       try (FileReader reader = new FileReader(filePath)) {
           Object obj = parser.parse(reader);
           JSONObject jsonObject = (JSONObject) obj;
           JSONArray stepsArray = (JSONArray) jsonObject.get("Steps");
           for (Object stepObj : stepsArray) {
               JSONObject step = (JSONObject) stepObj;
               if (step.containsKey("FunctionArn")) {
                   step.put("FunctionArn", functionArn);
```

```
                }
            }
            System.out.println(jsonObject);

            // Create the pipeline.
            CreatePipelineRequest pipelineRequest = CreatePipelineRequest.builder()
                    .pipelineDescription("Java SDK example pipeline")
                    .roleArn(roleArn)
                    .pipelineName(pipelineName)
                    .pipelineDefinition(jsonObject.toString())
                    .build();

            sageMakerClient.createPipeline(pipelineRequest);

        } catch (IamException e) {
            System.err.println(e.awsErrorDetails().errorMessage());
            System.exit(1);
        } catch (IOException | ParseException e) {
            throw new RuntimeException(e);
        }
    }
```

- For API details, see CreatePipeline in *AWS SDK for Java 2.x API Reference*.

`DeletePipeline`

The following code example shows how to use `DeletePipeline`.

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
    // Delete a SageMaker pipeline by name.
    public static void deletePipeline(SageMakerClient sageMakerClient, String
pipelineName) {
        DeletePipelineRequest pipelineRequest = DeletePipelineRequest.builder()
                .pipelineName(pipelineName)
```

```
                .build();

        sageMakerClient.deletePipeline(pipelineRequest);
        System.out.println("*** Successfully deleted " + pipelineName);
    }
```

- For API details, see DeletePipeline in *AWS SDK for Java 2.x API Reference*.

`DescribePipelineExecution`

The following code example shows how to use `DescribePipelineExecution`.

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
   // Check the status of a pipeline execution.
   public static void waitForPipelineExecution(SageMakerClient sageMakerClient,
String executionArn)
           throws InterruptedException {
       String status;
       int index = 0;
       do {
           DescribePipelineExecutionRequest pipelineExecutionRequest =
DescribePipelineExecutionRequest.builder()
                   .pipelineExecutionArn(executionArn)
                   .build();

           DescribePipelineExecutionResponse response = sageMakerClient
                   .describePipelineExecution(pipelineExecutionRequest);
           status = response.pipelineExecutionStatusAsString();
           System.out.println(index + ". The Status of the pipeline is " + status);
           TimeUnit.SECONDS.sleep(4);
           index++;
       } while ("Executing".equals(status));
       System.out.println("Pipeline finished with status " + status);
   }
```

- For API details, see DescribePipelineExecution in *AWS SDK for Java 2.x API Reference*.

`StartPipelineExecution`

The following code example shows how to use `StartPipelineExecution`.

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
    // Start a pipeline run with job configurations.
    public static String executePipeline(SageMakerClient sageMakerClient, String
 bucketName, String queueUrl,
            String roleArn, String pipelineName) {

        return response.pipelineExecutionArn();
    }
```

- For API details, see StartPipelineExecution in *AWS SDK for Java 2.x API Reference*.

Scenarios

Get started with geospatial jobs and pipelines

The following code example shows how to:

- Set up resources for a pipeline.
- Set up a pipeline that executes a geospatial job.
- Start a pipeline execution.
- Monitor the status of the execution.

- View the output of the pipeline.
- Clean up resources.

For more information, see Create and run SageMaker pipelines using AWS SDKs on Community.aws.

Scenarios

Create a web application to track DynamoDB data

The following code example shows how to create a web application that tracks work items in an Amazon DynamoDB table and uses Amazon Simple Email Service (Amazon SES) to send reports.

SDK for Java 2.x

Shows how to use the Amazon DynamoDB API to create a dynamic web application that tracks DynamoDB work data.

For complete source code and instructions on how to set up and run, see the full example on GitHub.

Services used in this example

- DynamoDB
- Amazon SES

Create a web application to track Amazon Redshift data

The following code example shows how to create a web application that tracks and reports on work items using an Amazon Redshift database.

SDK for Java 2.x

Shows how to create a web application that tracks and reports on work items stored in an Amazon Redshift database.

For complete source code and instructions on how to set up a Spring REST API that queries Amazon Redshift data and for use by a React application, see the full example on GitHub.

Services used in this example

- Amazon Redshift
- Amazon SES

Create an Aurora Serverless work item tracker

The following code example shows how to create a web application that tracks work items in an Amazon Aurora Serverless database and uses Amazon Simple Email Service (Amazon SES) to send reports.

SDK for Java 2.x

Shows how to create a web application that tracks and reports on work items stored in an Amazon RDS database.

For complete source code and instructions on how to set up a Spring REST API that queries Amazon Aurora Serverless data and for use by a React application, see the full example on GitHub.

For complete source code and instructions on how to set up and run an example that uses the JDBC API, see the full example on GitHub.

Services used in this example

- Aurora
- Amazon RDS
- Amazon RDS Data Service
- Amazon SES

Detect PPE in images

The following code example shows how to build an app that uses Amazon Rekognition to detect Personal Protective Equipment (PPE) in images.

SDK for Java 2.x

Shows how to create an AWS Lambda function that detects images with Personal Protective Equipment.

For complete source code and instructions on how to set up and run, see the full example on GitHub.

Services used in this example

- DynamoDB
- Amazon Rekognition

- Amazon S3
- Amazon SES

Detect objects in images

The following code example shows how to build an app that uses Amazon Rekognition to detect objects by category in images.

SDK for Java 2.x

Shows how to use Amazon Rekognition Java API to create an app that uses Amazon Rekognition to identify objects by category in images located in an Amazon Simple Storage Service (Amazon S3) bucket. The app sends the admin an email notification with the results using Amazon Simple Email Service (Amazon SES).

For complete source code and instructions on how to set up and run, see the full example on GitHub.

Services used in this example

- Amazon Rekognition
- Amazon S3
- Amazon SES

Detect people and objects in a video

The following code example shows how to detect people and objects in a video with Amazon Rekognition.

SDK for Java 2.x

Shows how to use Amazon Rekognition Java API to create an app to detect faces and objects in videos located in an Amazon Simple Storage Service (Amazon S3) bucket. The app sends the admin an email notification with the results using Amazon Simple Email Service (Amazon SES).

For complete source code and instructions on how to set up and run, see the full example on GitHub.

Services used in this example

- Amazon Rekognition

- Amazon S3
- Amazon SES
- Amazon SNS
- Amazon SQS

Use Step Functions to invoke Lambda functions

The following code example shows how to create an AWS Step Functions state machine that invokes AWS Lambda functions in sequence.

SDK for Java 2.x

Shows how to create an AWS serverless workflow by using AWS Step Functions and the AWS SDK for Java 2.x. Each workflow step is implemented using an AWS Lambda function.

For complete source code and instructions on how to set up and run, see the full example on GitHub.

Services used in this example

- DynamoDB
- Lambda
- Amazon SES
- Step Functions

Amazon SES API v2 examples using SDK for Java 2.x

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Java 2.x with Amazon SES API v2.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Scenarios are code examples that show you how to accomplish specific tasks by calling multiple functions within a service or combined with other AWS services.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

`CreateContactList`

The following code example shows how to use `CreateContactList`.

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
    try {
```

```
      // 2. Create a contact list
      String contactListName = CONTACT_LIST_NAME;
      CreateContactListRequest createContactListRequest =
 CreateContactListRequest.builder()
          .contactListName(contactListName)
          .build();
      sesClient.createContactList(createContactListRequest);
      System.out.println("Contact list created: " + contactListName);
    } catch (AlreadyExistsException e) {
      System.out.println("Contact list already exists, skipping creation: weekly-
coupons-newsletter");
    } catch (LimitExceededException e) {
      System.err.println("Limit for contact lists has been exceeded.");
      throw e;
    } catch (SesV2Exception e) {
      System.err.println("Error creating contact list: " + e.getMessage());
      throw e;
    }
```

- For API details, see CreateContactList in *AWS SDK for Java 2.x API Reference*.

`CreateEmailIdentity`

The following code example shows how to use `CreateEmailIdentity`.

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
    try {
      CreateEmailIdentityRequest createEmailIdentityRequest =
 CreateEmailIdentityRequest.builder()
          .emailIdentity(verifiedEmail)
          .build();
      sesClient.createEmailIdentity(createEmailIdentityRequest);
      System.out.println("Email identity created: " + verifiedEmail);
    } catch (AlreadyExistsException e) {
```

```
      System.out.println("Email identity already exists, skipping creation: " +
 verifiedEmail);
    } catch (NotFoundException e) {
      System.err.println("The provided email address is not verified: " +
 verifiedEmail);
      throw e;
    } catch (LimitExceededException e) {
      System.err
          .println("You have reached the limit for email identities. Please remove
 some identities and try again.");
      throw e;
    } catch (SesV2Exception e) {
      System.err.println("Error creating email identity: " + e.getMessage());
      throw e;
    }
```

- For API details, see CreateEmailIdentity in *AWS SDK for Java 2.x API Reference*.

`CreateEmailTemplate`

The following code example shows how to use `CreateEmailTemplate`.

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
    try {
      // Create an email template named "weekly-coupons"
      String newsletterHtml = loadFile("resources/coupon_newsletter/coupon-
newsletter.html");
      String newsletterText = loadFile("resources/coupon_newsletter/coupon-
newsletter.txt");

      CreateEmailTemplateRequest templateRequest =
 CreateEmailTemplateRequest.builder()
          .templateName(TEMPLATE_NAME)
          .templateContent(EmailTemplateContent.builder()
```

```
                .subject("Weekly Coupons Newsletter")
                .html(newsletterHtml)
                .text(newsletterText)
                .build())
            .build();

      sesClient.createEmailTemplate(templateRequest);

      System.out.println("Email template created: " + TEMPLATE_NAME);
    } catch (AlreadyExistsException e) {
      // If the template already exists, skip this step and proceed with the next
      // operation
      System.out.println("Email template already exists, skipping creation...");
    } catch (LimitExceededException e) {
      // If the limit for email templates is exceeded, fail the workflow and inform
      // the user
      System.err.println("You have reached the limit for email templates. Please
remove some templates and try again.");
      throw e;
    } catch (Exception e) {
      System.err.println("Error occurred while creating email template: " +
e.getMessage());
      throw e;
    }
```

`DeleteContactList`

The following code example shows how to use `DeleteContactList`.

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
    try {
      // Delete the contact list
```

```
     DeleteContactListRequest deleteContactListRequest =
DeleteContactListRequest.builder()
          .contactListName(CONTACT_LIST_NAME)
          .build();

     sesClient.deleteContactList(deleteContactListRequest);

     System.out.println("Contact list deleted: " + CONTACT_LIST_NAME);
   } catch (NotFoundException e) {
     // If the contact list does not exist, log the error and proceed
     System.out.println("Contact list not found. Skipping deletion...");
   } catch (Exception e) {
     System.err.println("Error occurred while deleting the contact list: " +
e.getMessage());
     e.printStackTrace();
   }
```

- For API details, see DeleteContactList in *AWS SDK for Java 2.x API Reference*.

`DeleteEmailIdentity`

The following code example shows how to use `DeleteEmailIdentity`.

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
     try {
       // Delete the email identity
       DeleteEmailIdentityRequest deleteIdentityRequest =
DeleteEmailIdentityRequest.builder()
            .emailIdentity(this.verifiedEmail)
            .build();

       sesClient.deleteEmailIdentity(deleteIdentityRequest);
```

```
        System.out.println("Email identity deleted: " + this.verifiedEmail);
      } catch (NotFoundException e) {
        // If the email identity does not exist, log the error and proceed
        System.out.println("Email identity not found. Skipping deletion...");
      } catch (Exception e) {
        System.err.println("Error occurred while deleting the email identity: " +
e.getMessage());
        e.printStackTrace();
      }
    } else {
      System.out.println("Skipping email identity deletion.");
    }
```

- For API details, see DeleteEmailIdentity in *AWS SDK for Java 2.x API Reference*.

`DeleteEmailTemplate`

The following code example shows how to use `DeleteEmailTemplate`.

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
    try {
      // Delete the template
      DeleteEmailTemplateRequest deleteTemplateRequest =
DeleteEmailTemplateRequest.builder()
          .templateName(TEMPLATE_NAME)
          .build();

      sesClient.deleteEmailTemplate(deleteTemplateRequest);

      System.out.println("Email template deleted: " + TEMPLATE_NAME);
    } catch (NotFoundException e) {

Amazon SNS examples using SDK for Java 2.x

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Java 2.x with Amazon SNS.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Scenarios are code examples that show you how to accomplish specific tasks by calling multiple functions within a service or combined with other AWS services.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Get started

Hello Amazon SNS

The following code examples show how to get started using Amazon SNS.

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
package com.example.sns;

import software.amazon.awssdk.regions.Region;
import software.amazon.awssdk.services.sns.SnsClient;
import software.amazon.awssdk.services.sns.model.SnsException;
import software.amazon.awssdk.services.sns.paginators.ListTopicsIterable;

public class HelloSNS {
    public static void main(String[] args) {
        SnsClient snsClient = SnsClient.builder()
                .region(Region.US_EAST_1)
                .build();

        listSNSTopics(snsClient);
        snsClient.close();
    }

    public static void listSNSTopics(SnsClient snsClient) {
        try {
            ListTopicsIterable listTopics = snsClient.listTopicsPaginator();
            listTopics.stream()
                    .flatMap(r -> r.topics().stream())
                    .forEach(content -> System.out.println(" Topic ARN: " +
 content.topicArn()));

        } catch (SnsException e) {
            System.err.println(e.awsErrorDetails().errorMessage());
            System.exit(1);
        }
    }
}
```

Scenarios

Build an app to submit data to a DynamoDB table

The following code example shows how to build an application that submits data to an Amazon DynamoDB table and notifies you when a user updates the table.

SDK for Java 2.x

Shows how to create a dynamic web application that submits data using the Amazon DynamoDB Java API and sends a text message using the Amazon Simple Notification Service Java API.

For complete source code and instructions on how to set up and run, see the full example on GitHub.

Services used in this example

- DynamoDB
- Amazon SNS

Building an Amazon SNS application

The following code example shows how to create an application that has subscription and publish functionality and translates messages.

SDK for Java 2.x

Shows how to use the Amazon Simple Notification Service Java API to create a web application that has subscription and publish functionality. In addition, this example application also translates messages.

For complete source code and instructions on how to set up and run, see the full example on GitHub.

For complete source code and instructions on how to set up and run the example that uses the Java Async API, see the full example on GitHub.

Services used in this example

- Amazon SNS
- Amazon Translate

Create a platform endpoint for push notifications

The following code example shows how to create a platform endpoint for Amazon SNS push notifications.

SDK for Java 2.x

        }
    }
}
```

Create a serverless application to manage photos

The following code example shows how to create a serverless application that lets users manage photos using labels.

SDK for Java 2.x

Shows how to develop a photo asset management application that detects labels in images using Amazon Rekognition and stores them for later retrieval.

For complete source code and instructions on how to set up and run, see the full example on GitHub.

For a deep dive into the origin of this example see the post on AWS Community.

Services used in this example

- API Gateway
- DynamoDB
- Lambda
- Amazon Rekognition
- Amazon S3
- Amazon SNS

Create and publish to a FIFO topic

The following code example shows how to create and publish to a FIFO Amazon SNS topic.

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

This example

- creates an Amazon SNS FIFO topic, two Amazon SQS FIFO queues, and one Standard queue.
- subscribes the queues to the topic and publishes a message to the topic.

The test verifies the receipt of the message to each queue. The complete example also shows the addition of access policies and deletes the resources at the end.

```
public class PriceUpdateExample {
    public final static SnsClient snsClient = SnsClient.create();
```

```
    public final static SqsClient sqsClient = SqsClient.create();

    public static void main(String[] args) {

        final String usage = "\n" +
            "Usage: " +
            "    <topicName> <wholesaleQueueFifoName> <retailQueueFifoName>
<analyticsQueueName>\n\n" +
            "Where:\n" +
            "   fifoTopicName - The name of the FIFO topic that you want to create.
\n\n" +
            "   wholesaleQueueARN - The name of a SQS FIFO queue that will be
created for the wholesale consumer. \n\n"
            +

    }
```

- For API details, see the following topics in *AWS SDK for Java 2.x API Reference*.
  - CreateTopic
  - Publish
  - Subscribe

Detect people and objects in a video

The following code example shows how to detect people and objects in a video with Amazon Rekognition.

SDK for Java 2.x

Shows how to use Amazon Rekognition Java API to create an app to detect faces and objects in videos located in an Amazon Simple Storage Service (Amazon S3) bucket. The app sends the admin an email notification with the results using Amazon Simple Email Service (Amazon SES).

For complete source code and instructions on how to set up and run, see the full example on GitHub.

Services used in this example

- Amazon Rekognition
- Amazon S3
- Amazon SES
- Amazon SNS
- Amazon SQS

Publish SMS messages to a topic

The following code example shows how to:

- Create an Amazon SNS topic.
- Subscribe phone numbers to the topic.
- Publish SMS messages to the topic so that all subscribed phone numbers receive the message at once.

SDK for Java 2.x

> **Note**

Publish messages to queues

The following code example shows how to:

- Create topic (FIFO or non-FIFO).

- Subscribe several queues to the topic with an option to apply a filter.
- Publish messages to the topic.
- Poll the queues for messages received.

Use API Gateway to invoke a Lambda function

The following code example shows how to create an AWS Lambda function invoked by Amazon API Gateway.

SDK for Java 2.x

Shows how to create an AWS Lambda function by using the Lambda Java runtime API. This example invokes different AWS services to perform a specific use case. This example demonstrates how to create a Lambda function invoked by Amazon API Gateway that scans an Amazon DynamoDB table for work anniversaries and uses Amazon Simple Notification Service (Amazon SNS) to send a text message to your employees that congratulates them at their one year anniversary date.

For complete source code and instructions on how to set up and run, see the full example on GitHub.

Services used in this example

- API Gateway
- DynamoDB
- Lambda
- Amazon SNS

Use scheduled events to invoke a Lambda function

The following code example shows how to create an AWS Lambda function invoked by an Amazon EventBridge scheduled event.

SDK for Java 2.x

Shows how to create an Amazon EventBridge scheduled event that invokes an AWS Lambda function. Configure EventBridge to use a cron expression to schedule when the Lambda function is invoked. In this example, you create a Lambda function by using the Lambda Java runtime API. This example invokes different AWS services to perform a specific use case. This example demonstrates how to create an app that sends a mobile text message to your employees that congratulates them at the one year anniversary date.

For complete source code and instructions on how to set up and run, see the full example on GitHub.

Services used in this example

- CloudWatch Logs
- DynamoDB
- EventBridge
- Lambda
- Amazon SNS

Serverless examples

Invoke a Lambda function from an Amazon SNS trigger

The following code example shows how to implement a Lambda function that receives an event triggered by receiving messages from an SNS topic. The function retrieves the messages from the event parameter and logs the content of each message.

SDK for Java 2.x

Amazon SQS examples using SDK for Java 2.x

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Java 2.x with Amazon SQS.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Scenarios are code examples that show you how to accomplish specific tasks by calling multiple functions within a service or combined with other AWS services.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Get started

Hello Amazon SQS

The following code examples show how to get started using Amazon SQS.

SDK for Java 2.x

            sqsClient.deleteQueue(deleteQueueRequest);

        } catch (SqsException e) {
            System.err.println(e.awsErrorDetails().errorMessage());
            System.exit(1);
        }
    }
}
```

- For API details, see DeleteQueue in *AWS SDK for Java 2.x API Reference*.

`GetQueueUrl`

The following code example shows how to use `GetQueueUrl`.

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
            GetQueueUrlResponse getQueueUrlResponse = sqsClient
```

```
.getQueueUrl(GetQueueUrlRequest.builder().queueName(queueName).build());
            return getQueueUrlResponse.queueUrl();
```

- For API details, see GetQueueUrl in *AWS SDK for Java 2.x API Reference*.

`ListQueues`

The following code example shows how to use `ListQueues`.

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
        String prefix = "que";

        try {
            ListQueuesRequest listQueuesRequest =
ListQueuesRequest.builder().queueNamePrefix(prefix).build();
            ListQueuesResponse listQueuesResponse =
sqsClient.listQueues(listQueuesRequest);
            for (String url : listQueuesResponse.queueUrls()) {
                System.out.println(url);
            }

        } catch (SqsException e) {
            System.err.println(e.awsErrorDetails().errorMessage());
            System.exit(1);
        }
```

- For API details, see ListQueues in *AWS SDK for Java 2.x API Reference*.

`ReceiveMessage`

The following code example shows how to use `ReceiveMessage`.

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
        try {
            ReceiveMessageRequest receiveMessageRequest =
ReceiveMessageRequest.builder()
                    .queueUrl(queueUrl)
                    .maxNumberOfMessages(5)
                    .build();
            return sqsClient.receiveMessage(receiveMessageRequest).messages();

        } catch (SqsException e) {
            System.err.println(e.awsErrorDetails().errorMessage());
            System.exit(1);
        }
        return null;
```

- For API details, see ReceiveMessage in *AWS SDK for Java 2.x API Reference*.

`SendMessage`

The following code example shows how to use `SendMessage`.

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Two examples of the `SendMessage` operation follow:

- Send a message with a body and a delay

- Send a message with a body and message attributes

Send a message with a body and a delay.

`SendMessageBatch`

The following code example shows how to use `SendMessageBatch`.

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
            SendMessageBatchRequest sendMessageBatchRequest =
SendMessageBatchRequest.builder()
                    .queueUrl(queueUrl)

.entries(SendMessageBatchRequestEntry.builder().id("id1").messageBody("Hello from
msg 1").build(),

SendMessageBatchRequestEntry.builder().id("id2").messageBody("msg
2").delaySeconds(10)
                                    .build())
                    .build();
            sqsClient.sendMessageBatch(sendMessageBatchRequest);
```

- For API details, see SendMessageBatch in *AWS SDK for Java 2.x API Reference*.

`SetQueueAttributes`

The following code example shows how to use `SetQueueAttributes`.

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Configure an Amazon SQS to use server-side encryption (SSE) using a custom KMS key.

```
    public static void addEncryption(String queueName, String kmsMasterKeyAlias) {
        SqsClient sqsClient = SqsClient.create();

        GetQueueUrlRequest urlRequest = GetQueueUrlRequest.builder()
                .queueName(queueName)
                .build();

        GetQueueUrlResponse getQueueUrlResponse;
        try {
            getQueueUrlResponse = sqsClient.getQueueUrl(urlRequest);
        } catch (QueueDoesNotExistException e) {
            LOGGER.error(e.getMessage(), e);
            throw new RuntimeException(e);
        }
        String queueUrl = getQueueUrlResponse.queueUrl();

        Map<QueueAttributeName, String> attributes = Map.of(
                QueueAttributeName.KMS_MASTER_KEY_ID, kmsMasterKeyAlias,
                QueueAttributeName.KMS_DATA_KEY_REUSE_PERIOD_SECONDS, "140" // Set
the data key reuse period to 140 seconds.
        );                                                                  // This
is how long SQS can reuse the data key before requesting a new one from KMS.

        SetQueueAttributesRequest attRequest = SetQueueAttributesRequest.builder()
                .queueUrl(queueUrl)
                .attributes(attributes)
                .build();
        try {
            sqsClient.setQueueAttributes(attRequest);
            LOGGER.info("The attributes have been applied to {}", queueName);
        } catch (InvalidAttributeNameException | InvalidAttributeValueException e) {
            LOGGER.error(e.getMessage(), e);
```

```
            throw new RuntimeException(e);
        } finally {
            sqsClient.close();
        }
    }
```

- For API details, see SetQueueAttributes in *AWS SDK for Java 2.x API Reference*.

Scenarios

Create a messaging application

The following code example shows how to create a messaging application by using Amazon SQS.

SDK for Java 2.x

Shows how to use the Amazon SQS API to develop a Spring REST API that sends and retrieves messages.

For complete source code and instructions on how to set up and run, see the full example on GitHub.

Services used in this example

- Amazon Comprehend
- Amazon SQS

Create and publish to a FIFO topic

The following code example shows how to create and publish to a FIFO Amazon SNS topic.

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

This example

- creates an Amazon SNS FIFO topic, two Amazon SQS FIFO queues, and one Standard queue.
- subscribes the queues to the topic and publishes a message to the topic.

The test verifies the receipt of the message to each queue. The complete example also shows the addition of access policies and deletes the resources at the end.

```
public class PriceUpdateExample {
    public final static SnsClient snsClient = SnsClient.create();
    public final static SqsClient sqsClient = SqsClient.create();

    public static void main(String[] args) {

        final String usage = "\n" +
            "Usage: " +
            "    <topicName> <wholesaleQueueFifoName> <retailQueueFifoName>
 <analyticsQueueName>\n\n" +
            "Where:\n" +
            "   fifoTopicName - The name of the FIFO topic that you want to create.
 \n\n" +
            "   wholesaleQueueARN - The name of a SQS FIFO queue that will be
 created for the wholesale consumer. \n\n"
            +
            "   retailQueueARN - The name of a SQS FIFO queue that will created for
 the retail consumer. \n\n" +
            "   analyticsQueueARN - The name of a SQS standard queue that will be
 created for the analytics consumer. \n\n";
        if (args.length != 4) {
            System.out.println(usage);
            System.exit(1);
        }

        final String fifoTopicName = args[0];
        final String wholeSaleQueueName = args[1];
        final String retailQueueName = args[2];
        final String analyticsQueueName = args[3];

Detect people and objects in a video

The following code example shows how to detect people and objects in a video with Amazon Rekognition.

SDK for Java 2.x

Shows how to use Amazon Rekognition Java API to create an app to detect faces and objects in videos located in an Amazon Simple Storage Service (Amazon S3) bucket. The app sends the admin an email notification with the results using Amazon Simple Email Service (Amazon SES).

For complete source code and instructions on how to set up and run, see the full example on GitHub.

Services used in this example

- Amazon Rekognition

- Amazon S3
- Amazon SES
- Amazon SNS
- Amazon SQS

Manage large messages using S3

The following code example shows how to use the Amazon SQS Extended Client Library to work with large Amazon SQS messages.

SDK for Java 2.x

Process S3 event notifications

The following code example shows how to work with S3 event notifications in an object-oriented way.

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

This example show how to process S3 notification event by using Amazon SQS.

```
    /**
     * This method receives S3 event notifications by using an SqsAsyncClient.
     * After the client receives the messages it deserializes the JSON payload and
 logs them. It uses
     * the S3EventNotification class (part of the S3 event notification API for
 Java) to deserialize
     * the JSON payload and access the messages in an object-oriented way.
     *
     * @param queueUrl The URL of the AWS SQS queue that receives the S3 event
 notifications.
     * @see <a href="https://sdk.amazonaws.com/java/api/latest/software/amazon/
awssdk/eventnotifications/s3/model/package-summary.html">S3EventNotification API</
a>.
     * <p>
     * To use S3 event notification serialization/deserialization to objects, add
 the following
     * dependency to your Maven pom.xml file.
     * <dependency>
     * <groupId>software.amazon.awssdk</groupId>
     * <artifactId>s3-event-notifications</artifactId>
     * <version><LATEST></version>
     * </dependency>
     * <p>
     * The S3 event notification API became available with version 2.25.11 of the
 Java SDK.
     * <p>
     * This example shows the use of the API with AWS SQS, but it can be used to
 process S3 event notifications
     * in AWS SNS or AWS Lambda as well.
     * <p>
     * Note: The S3EventNotification class does not work with messages routed
 through AWS EventBridge.
     */
```

```
   static void processS3Events(String bucketName, String queueUrl, String queueArn)
{
       try {
           // Configure the bucket to send Object Created and Object Tagging
notifications to an existing SQS queue.
           s3Client.putBucketNotificationConfiguration(b -> b
                   .notificationConfiguration(ncb -> ncb
                           .queueConfigurations(qcb -> qcb

Publish messages to queues

The following code example shows how to:

- Create topic (FIFO or non-FIFO).
- Subscribe several queues to the topic with an option to apply a filter.
- Publish messages to the topic.
- Poll the queues for messages received.

 * Before running this Java V2 code example, set up your development
 * environment, including your credentials.
 * <p>
 * For more information, see the following documentation topic:
 * <p>
 * https://docs.aws.amazon.com/sdk-for-java/latest/developer-guide/get-started.html
 * <p>
 * This Java example performs these tasks:
 * <p>
 * 1. Gives the user three options to choose from.
 * 2. Creates an Amazon Simple Notification Service (Amazon SNS) topic.
 * 3. Creates an Amazon Simple Queue Service (Amazon SQS) queue.
 * 4. Gets the SQS queue Amazon Resource Name (ARN) attribute.
 * 5. Attaches an AWS Identity and Access Management (IAM) policy to the queue.
 * 6. Subscribes to the SQS queue.
 * 7. Publishes a message to the topic.
 * 8. Displays the messages.
```

```
 * 9. Deletes the received message.
 * 10. Unsubscribes from the topic.
 * 11. Deletes the SNS topic.

Send and receive batches of messages

The following code example shows how to:

- Create an Amazon SQS queue.
- Send batches of messages to the queue.
- Receive batches of messages from the queue.
- Delete batches of messages from the queue.

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

As shown in the following examples, you can handle batch message operations with Amazon SQS using two different approaches with the AWS SDK for Java 2.x:

SendRecvBatch.java uses explicit batch operations. You manually create message batches and call `sendMessageBatch()` and `deleteMessageBatch()` directly. You also handle batch responses, including any failed messages. This approach gives you full control over batch sizing and error handling. However, it requires more code to manage the batching logic.

SimpleProducerConsumer.java uses the high-level `SqsAsyncBatchManager` library for automatic request batching. You make individual `sendMessage()` and `deleteMessage()` calls with the same method signatures as the standard client. The SDK automatically buffers these calls and sends them as batch operations. This approach requires minimal code changes while providing batching performance benefits.

Use explicit batching when you need fine-grained control over batch composition and error handling. Use automatic batching when you want to optimize performance with minimal code changes.

SendRecvBatch.java - Uses explicit batch operations with messages.

/**
 * Demonstrates the AWS SDK for Java 2.x Automatic Request Batching API for Amazon
 SQS.
 *
 * This example showcases the high-level SqsAsyncBatchManager library that provides
 * efficient batching and buffering for SQS operations. The batch manager offers
 * methods that directly mirror SqsAsyncClient methods—sendMessage,
 changeMessageVisibility,
 * deleteMessage, and receiveMessage—making it a drop-in replacement with minimal
 code changes.
 *
 * Key features of the SqsAsyncBatchManager:
 * - Automatic batching: The SDK automatically buffers individual requests and sends
 them
 *   as batches when maxBatchSize (default: 10) or sendRequestFrequency (default:
 200ms)
 *   thresholds are reached
```

```
 * - Familiar API: Method signatures match SqsAsyncClient exactly, requiring no
 learning curve
 * - Background optimization: The batch manager maintains internal buffers and
 handles
 *   batching logic transparently
 * - Asynchronous operations: All methods return CompletableFuture for non-blocking
 execution
 *
 * Performance benefits demonstrated:
 * - Reduced API calls: Multiple individual requests are consolidated into single
 batch operations
 * - Lower costs: Fewer API calls result in reduced SQS charges
 * - Higher throughput: Batch operations process more messages per second
 * - Efficient resource utilization: Fewer network round trips and better connection
 reuse
 *
 * This example compares:
 * 1. Single-message operations using SqsAsyncClient directly
 * 2. Batch operations using SqsAsyncBatchManager with identical method calls
 *
 * Usage patterns:
 * - Set batch size to 1 to use SqsAsyncClient for baseline performance measurement
 * - Set batch size > 1 to use SqsAsyncBatchManager for optimized batch processing
 * - Monitor real-time throughput metrics to observe performance improvements
 *
 * Prerequisites:
 * - AWS SDK for Java 2.x version 2.28.0 or later
 * - An existing SQS queue
 * - Valid AWS credentials configured
 *
 * The program displays real-time metrics showing the dramatic performance
 difference
 * between individual operations and automatic batching.

```

```
   /**
    * Receives and deletes messages using SqsAsyncBatchManager for automatic
optimization.
    *
    * This consumer demonstrates the AWS SDK for Java 2.x high-level batching
library
    * for message consumption. The SqsAsyncBatchManager provides two key
optimizations:
    *
    * 1. Receive optimization: Maintains an internal buffer of messages fetched in
the
    *    background, so receiveMessage() calls return immediately from the buffer
    * 2. Delete batching: Automatically buffers deleteMessage() calls and sends
them
    *    as DeleteMessageBatchRequest operations when thresholds are reached
    *
    * Key features:
    * - Identical API: receiveMessage() and deleteMessage() have the same
signatures
    *   as SqsAsyncClient methods, making this a true drop-in replacement
    * - Background fetching: The batch manager continuously fetches messages to
keep
    *   the internal buffer populated, reducing receive latency
    * - Automatic delete batching: Individual deleteMessage() calls are buffered
and
    *   sent as batch operations (up to 10 per batch, 200ms frequency)
    * - Transparent optimization: No application logic changes needed to benefit
    *
    * Performance benefits:
    * - Reduced API calls through automatic batching of delete operations
    * - Lower latency for receives due to background message buffering
    * - Higher overall throughput with fewer network round trips
    */
   private static class BatchConsumer extends Thread {
       final SqsAsyncBatchManager batchManager;
       final String queueUrl;
       final int batchSize;
       final AtomicInteger consumedCount;
       final AtomicBoolean stop;

       /**
        * Creates a consumer thread for batch operations.
        *
```

```
         * @param batchManager the batch manager for efficient message processing
         * @param queueUrl the URL of the source queue
         * @param batchSize the maximum number of messages to receive per batch
         * @param consumedCount shared counter for tracking processed messages
         * @param stop shared flag to signal thread termination
         */
        BatchConsumer(SqsAsyncBatchManager batchManager, String queueUrl, int
batchSize,
                      AtomicInteger consumedCount, AtomicBoolean stop) {
            this.batchManager = batchManager;
            this.queueUrl = queueUrl;
            this.batchSize = batchSize;
            this.consumedCount = consumedCount;
            this.stop = stop;
        }

        /**
         * Continuously receives and deletes messages using the high-level batching
library.
         *
         * Demonstrates the key advantage of SqsAsyncBatchManager: identical method
signatures
         * with automatic optimization. Notice how:
         *
         * - batchManager.receiveMessage() uses the same syntax as
sqsAsyncClient.receiveMessage()
         * - batchManager.deleteMessage() uses the same syntax as
sqsAsyncClient.deleteMessage()
         *
         * Behind the scenes, the batch manager:
         * 1. Maintains an internal message buffer populated by background fetching
         * 2. Returns messages immediately from the buffer (reduced latency)
         * 3. Automatically batches deleteMessage() calls into
DeleteMessageBatchRequest operations
         * 4. Sends batch deletes when maxBatchSize (10) or sendRequestFrequency
(200ms) is reached
         *
         * This provides significant performance improvements with zero code changes
         * compared to traditional SqsAsyncClient usage patterns.
         */

Use the Amazon SQS Java Messaging Library to work with the JMS interface

The following code example shows how to use the Amazon SQS Java Messaging Library to work with the JMS interface.

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

The following examples work with standard Amazon SQS queues and include:

- Sending a text message.
- Receiving messages synchronously.
- Receiving messages asynchronously.
- Receiving messages using CLIENT_ACKNOWLEDGE mode.
- Receiving messages using the UNORDERED_ACKNOWLEDGE mode.
- Using Spring to inject dependencies.
- A utility class that provides common methods used by the other examples.

For more information on using JMS with Amazon SQS, see the Amazon SQS Developer Guide.

Sending a text message.

```
   /**
    * This method establishes a connection to a standard Amazon SQS queue using the
Amazon SQS
    * Java Messaging Library and sends text messages to it. It uses JMS (Java
Message Service) API
    * with automatic acknowledgment mode to ensure reliable message delivery, and
automatically
    * manages all messaging resources.
    *
    * @throws JMSException If there is a problem connecting to or sending messages
to the queue
    */
   public static void doSendTextMessage() throws JMSException {
       // Create a connection factory.
       SQSConnectionFactory connectionFactory = new SQSConnectionFactory(
               new ProviderConfiguration(),
               SqsClient.create()
       );
```

```
        // Create the connection in a try-with-resources statement so that it's
closed automatically.
        try (SQSConnection connection = connectionFactory.createConnection()) {

            // Create the queue if needed.
            SqsJmsExampleUtils.ensureQueueExists(connection, QUEUE_NAME,
SqsJmsExampleUtils.QUEUE_VISIBILITY_TIMEOUT);

            // Create a session that uses the JMS auto-acknowledge mode.
            Session session = connection.createSession(false,
Session.AUTO_ACKNOWLEDGE);
            MessageProducer producer =
session.createProducer(session.createQueue(QUEUE_NAME));

            createAndSendMessages(session, producer);
        } // The connection closes automatically. This also closes the session.
        LOGGER.info("Connection closed");
    }

    /**
     * This method reads text input from the keyboard and sends each line as a
separate message
     * to a standard Amazon SQS queue using the Amazon SQS Java Messaging Library.
It continues
     * to accept input until the user enters an empty line, using JMS (Java Message
Service) API to
     * handle the message delivery.
     *
     * @param session The JMS session used to create messages
     * @param producer The JMS message producer used to send messages to the queue
     */
    private static void createAndSendMessages(Session session, MessageProducer
producer) {

Serverless examples

Invoke a Lambda function from an Amazon SQS trigger

The following code example shows how to implement a Lambda function that receives an event triggered by receiving messages from an SQS queue. The function retrieves the messages from the event parameter and logs the content of each message.

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Serverless examples repository.

Consuming an SQS event with Lambda using Java.

```
// Copyright Amazon.com, Inc. or its affiliates. All Rights Reserved.
// SPDX-License-Identifier: Apache-2.0
import com.amazonaws.services.lambda.runtime.Context;
import com.amazonaws.services.lambda.runtime.RequestHandler;
import com.amazonaws.services.lambda.runtime.events.SQSEvent;
import com.amazonaws.services.lambda.runtime.events.SQSEvent.SQSMessage;

public class Function implements RequestHandler<SQSEvent, Void> {
    @Override
    public Void handleRequest(SQSEvent sqsEvent, Context context) {
        for (SQSMessage msg : sqsEvent.getRecords()) {
            processMessage(msg, context);
        }
        context.getLogger().log("done");
        return null;
    }

    private void processMessage(SQSMessage msg, Context context) {
        try {
            context.getLogger().log("Processed message " + msg.getBody());

            // TODO: Do interesting work based on the new message

        } catch (Exception e) {
            context.getLogger().log("An error occurred");
            throw e;
        }

    }
}
```

Reporting batch item failures for Lambda functions with an Amazon SQS trigger

The following code example shows how to implement partial batch response for Lambda functions that receive events from an SQS queue. The function reports the batch item failures in the response, signaling to Lambda to retry those messages later.

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Serverless examples repository.

Reporting SQS batch item failures with Lambda using Java.

```
// Copyright Amazon.com, Inc. or its affiliates. All Rights Reserved.

import java.util.ArrayList;
import java.util.List;

public class ProcessSQSMessageBatch implements RequestHandler<SQSEvent,
 SQSBatchResponse> {
    @Override
    public SQSBatchResponse handleRequest(SQSEvent sqsEvent, Context context) {

        List<SQSBatchResponse.BatchItemFailure> batchItemFailures = new
 ArrayList<SQSBatchResponse.BatchItemFailure>();
        String messageId = "";
        for (SQSEvent.SQSMessage message : sqsEvent.getRecords()) {
            try {
                //process your message
            } catch (Exception e) {
                //Add failed message identifier to the batchItemFailures list
                batchItemFailures.add(new
 SQSBatchResponse.BatchItemFailure(message.getMessageId()));
            }
```

```
        }
        return new SQSBatchResponse(batchItemFailures);
    }
}
```

Step Functions examples using SDK for Java 2.x

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Java 2.x with Step Functions.

Basics are code examples that show you how to perform the essential operations within a service.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Scenarios are code examples that show you how to accomplish specific tasks by calling multiple functions within a service or combined with other AWS services.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Get started

Hello Step Functions

The following code examples show how to get started using Step Functions.

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Java version of Hello.

```
import software.amazon.awssdk.regions.Region;
import software.amazon.awssdk.services.sfn.SfnClient;
```

```
import software.amazon.awssdk.services.sfn.model.ListStateMachinesResponse;
import software.amazon.awssdk.services.sfn.model.SfnException;
import software.amazon.awssdk.services.sfn.model.StateMachineListItem;
import java.util.List;

/**
 * Before running this Java V2 code example, set up your development
 * environment, including your credentials.
 *

- Actions
- Scenarios

Basics

Learn the basics

The following code example shows how to:

- Create an activity.
- Create a state machine from an Amazon States Language definition that contains the previously created activity as a step.
- Run the state machine and respond to the activity with user input.
- Get the final status and output after the run completes, then clean up resources.

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
/**
 * You can obtain the JSON file to create a state machine in the following
 * GitHub location.
 * <p>
 * https://github.com/awsdocs/aws-doc-sdk-examples/tree/main/resources/sample_files
 * <p>
 * To run this code example, place the chat_sfn_state_machine.json file into
 * your project's resources folder.
 * <p>
 * Also, set up your development environment, including your credentials.
 * <p>
 * For information, see this documentation topic:
```

```
 * <p>
 * https://docs.aws.amazon.com/sdk-for-java/latest/developer-guide/get-started.html
 * <p>
 * This Java code example performs the following tasks:
 * <p>
 * 1. Creates an activity.
 * 2. Creates a state machine.
 * 3. Describes the state machine.
 * 4. Starts execution of the state machine and interacts with it.
 * 5. Describes the execution.
 * 6. Delete the activity.
 * 7. Deletes the state machine.

Actions

`CreateActivity`

The following code example shows how to use `CreateActivity`.

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
    public static String createActivity(SfnClient sfnClient, String activityName) {
        try {
            CreateActivityRequest activityRequest = CreateActivityRequest.builder()
                .name(activityName)
                .build();

            CreateActivityResponse response =
sfnClient.createActivity(activityRequest);
            return response.activityArn();

        } catch (SfnException e) {
            System.err.println(e.awsErrorDetails().errorMessage());
            System.exit(1);
        }
        return "";
    }
```

- For API details, see CreateActivity in *AWS SDK for Java 2.x API Reference*.

`CreateStateMachine`

The following code example shows how to use `CreateStateMachine`.

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
   public static String createMachine(SfnClient sfnClient, String roleARN, String
stateMachineName, String json) {
       try {
           CreateStateMachineRequest machineRequest =
CreateStateMachineRequest.builder()
               .definition(json)
               .name(stateMachineName)
               .roleArn(roleARN)
               .type(StateMachineType.STANDARD)
               .build();

           CreateStateMachineResponse response =
sfnClient.createStateMachine(machineRequest);
           return response.stateMachineArn();

       } catch (SfnException e) {
           System.err.println(e.awsErrorDetails().errorMessage());
           System.exit(1);
       }
       return "";
   }
```

- For API details, see CreateStateMachine in *AWS SDK for Java 2.x API Reference*.

`DeleteActivity`

The following code example shows how to use `DeleteActivity`.

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
   public static void deleteActivity(SfnClient sfnClient, String actArn) {
       try {
           DeleteActivityRequest activityRequest = DeleteActivityRequest.builder()
               .activityArn(actArn)
```

```
                .build();

            sfnClient.deleteActivity(activityRequest);
            System.out.println("You have deleted " + actArn);

        } catch (SfnException e) {
            System.err.println(e.awsErrorDetails().errorMessage());
            System.exit(1);
        }
    }
```

- For API details, see DeleteActivity in *AWS SDK for Java 2.x API Reference*.

`DeleteStateMachine`

The following code example shows how to use `DeleteStateMachine`.

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
    public static void deleteMachine(SfnClient sfnClient, String stateMachineArn) {
        try {
            DeleteStateMachineRequest deleteStateMachineRequest =
DeleteStateMachineRequest.builder()
                .stateMachineArn(stateMachineArn)
                .build();

            sfnClient.deleteStateMachine(deleteStateMachineRequest);
            DescribeStateMachineRequest describeStateMachine =
DescribeStateMachineRequest.builder()
                .stateMachineArn(stateMachineArn)
                .build();

            while (true) {
                DescribeStateMachineResponse response =
sfnClient.describeStateMachine(describeStateMachine);
```

```
                System.out.println("The state machine is not deleted yet. The status
is " + response.status());
                Thread.sleep(3000);
            }

        } catch (SfnException | InterruptedException e) {
            System.err.println(e.getMessage());
        }
        System.out.println(stateMachineArn + " was successfully deleted.");
    }
```

- For API details, see DeleteStateMachine in *AWS SDK for Java 2.x API Reference*.

`DescribeExecution`

The following code example shows how to use `DescribeExecution`.

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
    public static void describeExe(SfnClient sfnClient, String executionArn) {
        try {
            DescribeExecutionRequest executionRequest =
DescribeExecutionRequest.builder()
                .executionArn(executionArn)
                .build();

            String status = "";
            boolean hasSucceeded = false;
            while (!hasSucceeded) {
                DescribeExecutionResponse response =
sfnClient.describeExecution(executionRequest);
                status = response.statusAsString();
                if (status.compareTo("RUNNING") == 0) {
                    System.out.println("The state machine is still running, let's
wait for it to finish.");
```

```
                    Thread.sleep(2000);
                } else if (status.compareTo("SUCCEEDED") == 0) {
                    System.out.println("The Step Function workflow has succeeded");
                    hasSucceeded = true;
                } else {
                    System.out.println("The Status is neither running or
succeeded");
                }
            }
            System.out.println("The Status is " + status);

        } catch (SfnException | InterruptedException e) {
            System.err.println(e.getMessage());
            System.exit(1);
        }
    }
```

- For API details, see DescribeExecution in *AWS SDK for Java 2.x API Reference*.

`DescribeStateMachine`

The following code example shows how to use `DescribeStateMachine`.

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
    public static void describeStateMachine(SfnClient sfnClient, String
stateMachineArn) {
        try {
            DescribeStateMachineRequest stateMachineRequest =
DescribeStateMachineRequest.builder()
                .stateMachineArn(stateMachineArn)
                .build();

            DescribeStateMachineResponse response =
sfnClient.describeStateMachine(stateMachineRequest);
```

```
            System.out.println("The name of the State machine is " +
response.name());
            System.out.println("The status of the State machine is " +
response.status());
            System.out.println("The ARN value of the State machine is " +
response.stateMachineArn());
            System.out.println("The role ARN value is " + response.roleArn());

        } catch (SfnException e) {
            System.err.println(e.getMessage());
        }
    }
```

- For API details, see DescribeStateMachine in *AWS SDK for Java 2.x API Reference*.

`GetActivityTask`

The following code example shows how to use `GetActivityTask`.

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
    public static List<String> getActivityTask(SfnClient sfnClient, String actArn) {
        List<String> myList = new ArrayList<>();
        GetActivityTaskRequest getActivityTaskRequest =
GetActivityTaskRequest.builder()
            .activityArn(actArn)
            .build();

        GetActivityTaskResponse response =
sfnClient.getActivityTask(getActivityTaskRequest);
        myList.add(response.taskToken());
        myList.add(response.input());
        return myList;
    }
```

- For API details, see GetActivityTask in *AWS SDK for Java 2.x API Reference*.

`ListActivities`

The following code example shows how to use `ListActivities`.

```
   public static String startWorkflow(SfnClient sfnClient, String stateMachineArn,
String jsonEx) {
       UUID uuid = UUID.randomUUID();
       String uuidValue = uuid.toString();
       try {
           StartExecutionRequest executionRequest = StartExecutionRequest.builder()
               .input(jsonEx)
               .stateMachineArn(stateMachineArn)
               .name(uuidValue)
               .build();

           StartExecutionResponse response =
sfnClient.startExecution(executionRequest);
           return response.executionArn();

       } catch (SfnException e) {
           System.err.println(e.awsErrorDetails().errorMessage());
           System.exit(1);
       }
       return "";
   }
```

- For API details, see StartExecution in *AWS SDK for Java 2.x API Reference*.

Scenarios

Use Step Functions to invoke Lambda functions

The following code example shows how to create an AWS Step Functions state machine that invokes AWS Lambda functions in sequence.

SDK for Java 2.x

Shows how to create an AWS serverless workflow by using AWS Step Functions and the AWS SDK for Java 2.x. Each workflow step is implemented using an AWS Lambda function.

For complete source code and instructions on how to set up and run, see the full example on GitHub.

Services used in this example

- DynamoDB

- Lambda
- Amazon SES
- Step Functions

AWS STS examples using SDK for Java 2.x

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Java 2.x with AWS STS.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

```

```
import java.time.ZoneId;
import java.time.format.DateTimeFormatter;
import java.time.format.FormatStyle;
import java.util.Locale;

/**
 * To make this code example work, create a Role that you want to assume.
 * Then define a Trust Relationship in the AWS Console. You can use this as an
 * example:
 *
 * {
 * "Version": "2012-10-17",
 * "Statement": [
 * {
 * "Effect": "Allow",
 * "Principal": {
 * "AWS": "<Specify the ARN of your IAM user you are using in this code
 * example>"
 * },
 * "Action": "sts:AssumeRole"
 * }
 * ]
 * }
 *
 * For more information, see "Editing the Trust Relationship for an Existing
 * Role" in the AWS Directory Service guide.
 *
 * Also, set up your development environment, including your credentials.
 *
 * For information, see this documentation topic:
 *
 * https://docs.aws.amazon.com/sdk-for-java/latest/developer-guide/get-started.html
 */

Support examples using SDK for Java 2.x

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Java 2.x with Support.

Basics are code examples that show you how to perform the essential operations within a service.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Get started

Hello Support

The following code examples show how to get started using Support.

SDK for Java 2.x

Basics

Learn the basics

The following code example shows how to:

- Get and display available services and severity levels for cases.
- Create a support case using a selected service, category, and severity level.
- Get and display a list of open cases for the current day.
- Add an attachment set and a communication to the new case.
- Describe the new attachment and communication for the case.
- Resolve the case.
- Get and display a list of resolved cases for the current day.

Actions

`AddAttachmentsToSet`

The following code example shows how to use `AddAttachmentsToSet`.

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
   public static String addAttachment(SupportClient supportClient, String
fileAttachment) {
       try {
           File myFile = new File(fileAttachment);
           InputStream sourceStream = new FileInputStream(myFile);
           SdkBytes sourceBytes = SdkBytes.fromInputStream(sourceStream);

           Attachment attachment = Attachment.builder()
                   .fileName(myFile.getName())
                   .data(sourceBytes)
                   .build();

           AddAttachmentsToSetRequest setRequest =
AddAttachmentsToSetRequest.builder()
                   .attachments(attachment)
                   .build();

           AddAttachmentsToSetResponse response =
supportClient.addAttachmentsToSet(setRequest);
           return response.attachmentSetId();

       } catch (SupportException | FileNotFoundException e) {
           System.out.println(e.getLocalizedMessage());
           System.exit(1);
       }
       return "";
   }
```

- For API details, see AddAttachmentsToSet in *AWS SDK for Java 2.x API Reference*.

`AddCommunicationToCase`

The following code example shows how to use `AddCommunicationToCase`.

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
   public static void addAttachSupportCase(SupportClient supportClient, String
caseId, String attachmentSetId) {
       try {
           AddCommunicationToCaseRequest caseRequest =
AddCommunicationToCaseRequest.builder()
                   .caseId(caseId)
                   .attachmentSetId(attachmentSetId)
                   .communicationBody("Please refer to attachment for details.")
                   .build();

           AddCommunicationToCaseResponse response =
supportClient.addCommunicationToCase(caseRequest);
           if (response.result())
               System.out.println("You have successfully added a communication to
an AWS Support case");
           else
               System.out.println("There was an error adding the communication to
an AWS Support case");

       } catch (SupportException e) {
           System.out.println(e.getLocalizedMessage());
           System.exit(1);
       }
   }
```

- For API details, see AddCommunicationToCase in *AWS SDK for Java 2.x API Reference*.

`CreateCase`

The following code example shows how to use `CreateCase`.

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
   public static String createSupportCase(SupportClient supportClient, List<String>
sevCatList, String sevLevel) {
       try {
           String serviceCode = sevCatList.get(0);
           String caseCat = sevCatList.get(1);
           CreateCaseRequest caseRequest = CreateCaseRequest.builder()
                   .categoryCode(caseCat.toLowerCase())
                   .serviceCode(serviceCode.toLowerCase())
                   .severityCode(sevLevel.toLowerCase())
                   .communicationBody("Test issue with " +
serviceCode.toLowerCase())
                   .subject("Test case, please ignore")
                   .language("en")
                   .issueType("technical")
                   .build();

           CreateCaseResponse response = supportClient.createCase(caseRequest);
           return response.caseId();

       } catch (SupportException e) {
           System.out.println(e.getLocalizedMessage());
           System.exit(1);
       }
       return "";
   }
```

- For API details, see CreateCase in *AWS SDK for Java 2.x API Reference*.

`DescribeAttachment`

The following code example shows how to use `DescribeAttachment`.

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
   public static void describeAttachment(SupportClient supportClient, String
attachId) {
       try {
           DescribeAttachmentRequest attachmentRequest =
DescribeAttachmentRequest.builder()
                   .attachmentId(attachId)
                   .build();

           DescribeAttachmentResponse response =
supportClient.describeAttachment(attachmentRequest);
           System.out.println("The name of the file is " +
response.attachment().fileName());

       } catch (SupportException e) {
           System.out.println(e.getLocalizedMessage());
           System.exit(1);
       }
   }
```

- For API details, see DescribeAttachment in *AWS SDK for Java 2.x API Reference*.

`DescribeCases`

The following code example shows how to use `DescribeCases`.

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
   public static void getOpenCase(SupportClient supportClient) {
       try {
           // Specify the start and end time.
           Instant now = Instant.now();
           java.time.LocalDate.now();
           Instant yesterday = now.minus(1, ChronoUnit.DAYS);

           DescribeCasesRequest describeCasesRequest =
DescribeCasesRequest.builder()
                   .maxResults(20)
                   .afterTime(yesterday.toString())
                   .beforeTime(now.toString())
                   .build();

           DescribeCasesResponse response =
supportClient.describeCases(describeCasesRequest);
           List<CaseDetails> cases = response.cases();
           for (CaseDetails sinCase : cases) {
               System.out.println("The case status is " + sinCase.status());
               System.out.println("The case Id is " + sinCase.caseId());
               System.out.println("The case subject is " + sinCase.subject());
           }

       } catch (SupportException e) {
           System.out.println(e.getLocalizedMessage());
           System.exit(1);
       }
   }
```

- For API details, see DescribeCases in *AWS SDK for Java 2.x API Reference*.

`DescribeCommunications`

The following code example shows how to use `DescribeCommunications`.

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
   public static String listCommunications(SupportClient supportClient, String
caseId) {
       try {
           String attachId = null;
           DescribeCommunicationsRequest communicationsRequest =
DescribeCommunicationsRequest.builder()
                   .caseId(caseId)
                   .maxResults(10)
                   .build();

           DescribeCommunicationsResponse response =
supportClient.describeCommunications(communicationsRequest);
           List<Communication> communications = response.communications();
           for (Communication comm : communications) {
               System.out.println("the body is: " + comm.body());

               // Get the attachment id value.
               List<AttachmentDetails> attachments = comm.attachmentSet();
               for (AttachmentDetails detail : attachments) {
                   attachId = detail.attachmentId();
               }
           }
           return attachId;

       } catch (SupportException e) {
           System.out.println(e.getLocalizedMessage());
           System.exit(1);
       }
       return "";
   }
```

- For API details, see DescribeCommunications in *AWS SDK for Java 2.x API Reference*.

`DescribeServices`

The following code example shows how to use `DescribeServices`.

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
   // Return a List that contains a Service name and Category name.
   public static List<String> displayServices(SupportClient supportClient) {
       try {
           DescribeServicesRequest servicesRequest =
DescribeServicesRequest.builder()
                   .language("en")
                   .build();

           DescribeServicesResponse response =
supportClient.describeServices(servicesRequest);
           String serviceCode = null;
           String catName = null;
           List<String> sevCatList = new ArrayList<>();
           List<Service> services = response.services();

           System.out.println("Get the first 10 services");
           int index = 1;
           for (Service service : services) {
               if (index == 11)
                   break;

               System.out.println("The Service name is: " + service.name());
               if (service.name().compareTo("Account") == 0)
                   serviceCode = service.code();

               // Get the Categories for this service.
```

```
                List<Category> categories = service.categories();
                for (Category cat : categories) {
                    System.out.println("The category name is: " + cat.name());
                    if (cat.name().compareTo("Security") == 0)
                        catName = cat.name();
                }
                index++;
            }

            // Push the two values to the list.
            sevCatList.add(serviceCode);
            sevCatList.add(catName);
            return sevCatList;

        } catch (SupportException e) {
            System.out.println(e.getLocalizedMessage());
            System.exit(1);
        }
        return null;
    }
```

- For API details, see DescribeServices in *AWS SDK for Java 2.x API Reference*.

`DescribeSeverityLevels`

The following code example shows how to use `DescribeSeverityLevels`.

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
    public static String displaySevLevels(SupportClient supportClient) {
        try {
            DescribeSeverityLevelsRequest severityLevelsRequest =
DescribeSeverityLevelsRequest.builder()
                    .language("en")
                    .build();
```

```
            DescribeSeverityLevelsResponse response =
supportClient.describeSeverityLevels(severityLevelsRequest);
            List<SeverityLevel> severityLevels = response.severityLevels();
            String levelName = null;
            for (SeverityLevel sevLevel : severityLevels) {
                System.out.println("The severity level name is: " +
sevLevel.name());
                if (sevLevel.name().compareTo("High") == 0)
                    levelName = sevLevel.name();
            }
            return levelName;

        } catch (SupportException e) {
            System.out.println(e.getLocalizedMessage());
            System.exit(1);
        }
        return "";
    }
```

- For API details, see DescribeSeverityLevels in *AWS SDK for Java 2.x API Reference*.

`ResolveCase`

The following code example shows how to use `ResolveCase`.

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
    public static void resolveSupportCase(SupportClient supportClient, String
caseId) {
        try {
            ResolveCaseRequest caseRequest = ResolveCaseRequest.builder()
                    .caseId(caseId)
                    .build();
```

```
            ResolveCaseResponse response = supportClient.resolveCase(caseRequest);
            System.out.println("The status of case " + caseId + " is " +
response.finalCaseStatus());

        } catch (SupportException e) {
            System.out.println(e.getLocalizedMessage());
            System.exit(1);
        }
    }
```

- For API details, see ResolveCase in *AWS SDK for Java 2.x API Reference*.

Systems Manager examples using SDK for Java 2.x

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Java 2.x with Systems Manager.

Basics are code examples that show you how to perform the essential operations within a service.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Get started

Hello Systems Manager

The following code examples show how to get started using Systems Manager.

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
import software.amazon.awssdk.regions.Region;
```

```
import software.amazon.awssdk.services.ssm.SsmClient;
import software.amazon.awssdk.services.ssm.model.DocumentFilter;
import software.amazon.awssdk.services.ssm.model.ListDocumentsRequest;
import software.amazon.awssdk.services.ssm.model.ListDocumentsResponse;

public class HelloSSM {

    public static void main(String[] args) {
        final String usage = """

                Usage:
                    <awsAccount>

                Where:
                    awsAccount - Your AWS Account number.
                """;

        if (args.length != 1) {
            System.out.println(usage);
            System.exit(1);
        }

Basics

Learn the basics

The following code example shows how to:

- Create a maintenance window.
- Modify the maintenance window schedule.
- Create a document.
- Send a command to a specified EC2 instance.
- Create an OpsItem.
- Update and resolve the OpsItem.
- Delete the maintenance window, OpsItem, and document.

                Welcome to the AWS Systems Manager SDK Basics scenario.
                This Java program demonstrates how to interact with AWS Systems
Manager using the AWS SDK for Java (v2).
                AWS Systems Manager is the operations hub for your AWS applications
and resources and a secure end-to-end management solution.
                The program's primary functionalities include creating a maintenance
window, creating a document, sending a command to a document,
                listing documents, listing commands, creating an OpsItem, modifying
an OpsItem, and deleting AWS SSM resources.
                Upon completion of the program, all AWS resources are cleaned up.
                Let's get started...

Amazon Textract examples using SDK for Java 2.x

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Java 2.x with Amazon Textract.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Scenarios are code examples that show you how to accomplish specific tasks by calling multiple functions within a service or combined with other AWS services.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Scenarios

Create an application to analyze customer feedback

The following code example shows how to create an application that analyzes customer comment cards, translates them from their original language, determines their sentiment, and generates an audio file from the translated text.

SDK for Java 2.x

This example application analyzes and stores customer feedback cards. Specifically, it fulfills the need of a fictitious hotel in New York City. The hotel receives feedback from guests in various

languages in the form of physical comment cards. That feedback is uploaded into the app through a web client. After an image of a comment card is uploaded, the following steps occur:

- Text is extracted from the image using Amazon Textract.
- Amazon Comprehend determines the sentiment of the extracted text and its language.
- The extracted text is translated to English using Amazon Translate.
- Amazon Polly synthesizes an audio file from the extracted text.

The full app can be deployed with the AWS CDK. For source code and deployment instructions, see the project in GitHub.

Services used in this example

- Amazon Comprehend
- Lambda
- Amazon Polly
- Amazon Textract
- Amazon Translate

Amazon Transcribe examples using SDK for Java 2.x

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Java 2.x with Amazon Transcribe.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Scenarios are code examples that show you how to accomplish specific tasks by calling multiple functions within a service or combined with other AWS services.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
public class ListTranscriptionJobs {
    public static void main(String[] args) {
        TranscribeClient transcribeClient = TranscribeClient.builder()
            .region(Region.US_EAST_1)
            .build();

            listTranscriptionJobs(transcribeClient);
        }

        public static void listTranscriptionJobs(TranscribeClient transcribeClient)
 {
            ListTranscriptionJobsRequest listJobsRequest =
 ListTranscriptionJobsRequest.builder()
                .build();

 transcribeClient.listTranscriptionJobsPaginator(listJobsRequest).stream()
                .flatMap(response -> response.transcriptionJobSummaries().stream())
                .forEach(jobSummary -> {
                    System.out.println("Job Name: " +
 jobSummary.transcriptionJobName());
                    System.out.println("Job Status: " +
 jobSummary.transcriptionJobStatus());
                    System.out.println("Output Location: " +
 jobSummary.outputLocationType());
                    // Add more information as needed

                    // Retrieve additional details for the job if necessary
```

```
                    GetTranscriptionJobResponse jobDetails =
transcribeClient.getTranscriptionJob(
                        GetTranscriptionJobRequest.builder()
                            .transcriptionJobName(jobSummary.transcriptionJobName())
                            .build());

                    // Display additional details
                    System.out.println("Language Code: " +
jobDetails.transcriptionJob().languageCode());
                    System.out.println("Media Format: " +
jobDetails.transcriptionJob().mediaFormat());
                    // Add more details as needed

                    System.out.println("--------------");
                });
        }
    }
```

- For API details, see ListTranscriptionJobs in *AWS SDK for Java 2.x API Reference*.

Scenarios

Transcribe audio and get job data

The following code example shows how to:

- Start a transcription job with Amazon Transcribe.
- Wait for the job to complete.
- Get the URI where the transcript is stored.

For more information, see Getting started with Amazon Transcribe.

SDK for Java 2.x

Amazon Transcribe Streaming examples using SDK for Java 2.x

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Java 2.x with Amazon Transcribe Streaming.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Scenarios are code examples that show you how to accomplish specific tasks by calling multiple functions within a service or combined with other AWS services.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Amazon Translate examples using SDK for Java 2.x

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Java 2.x with Amazon Translate.

Scenarios are code examples that show you how to accomplish specific tasks by calling multiple functions within a service or combined with other AWS services.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Scenarios

Scenarios

Building an Amazon Lex chatbot

The following code example shows how to create a chatbot to engage your website visitors.

SDK for Java 2.x

Shows how to use the Amazon Lex API to create a Chatbot within a web application to engage your web site visitors.

For complete source code and instructions on how to set up and run, see the full example on GitHub.

Services used in this example

- Amazon Comprehend
- Amazon Lex
- Amazon Translate

Building an Amazon SNS application

The following code example shows how to create an application that has subscription and publish functionality and translates messages.

SDK for Java 2.x

Shows how to use the Amazon Simple Notification Service Java API to create a web application that has subscription and publish functionality. In addition, this example application also translates messages.

For complete source code and instructions on how to set up and run, see the full example on GitHub.

For complete source code and instructions on how to set up and run the example that uses the Java Async API, see the full example on GitHub.

Services used in this example

- Amazon SNS
- Amazon Translate

Create an application to analyze customer feedback

The following code example shows how to create an application that analyzes customer comment cards, translates them from their original language, determines their sentiment, and generates an audio file from the translated text.

SDK for Java 2.x

This example application analyzes and stores customer feedback cards. Specifically, it fulfills the need of a fictitious hotel in New York City. The hotel receives feedback from guests in various languages in the form of physical comment cards. That feedback is uploaded into the app through a web client. After an image of a comment card is uploaded, the following steps occur:

- Text is extracted from the image using Amazon Textract.
- Amazon Comprehend determines the sentiment of the extracted text and its language.
- The extracted text is translated to English using Amazon Translate.
- Amazon Polly synthesizes an audio file from the extracted text.

The full app can be deployed with the AWS CDK. For source code and deployment instructions, see the project in GitHub.

Services used in this example

- Amazon Comprehend
- Lambda
- Amazon Polly
- Amazon Textract
- Amazon Translate

Migrate from version 1.x to 2.x of the AWS SDK for Java

The AWS SDK for Java 2.x is a major rewrite of the 1.x code base built on top of Java 8+. It includes many updates, such as improved consistency, ease of use, and strongly enforced immutability. This section describes the major features that are new in version 2.x, and provides guidance on how to migrate your code to version 2.x from 1.x.

Topics

- What's new in version 2
- How to migrate your code from AWS SDK for Java 1.x to 2.x
- What's different between the AWS SDK for Java 1.x and 2.x
- Use the SDK for Java 1.x and 2.x side-by-side

What's new in version 2

- You can configure your own HTTP clients. See HTTP transport configuration.
- Async clients feature non-blocking I/O support and return `CompletableFuture` objects. See Asynchronous programming.
- Operations that return multiple pages have autopaginated responses. This way, you can focus your code on what to do with the response, without the need to check for and get subsequent pages. See Pagination.
- SDK start time performance for AWS Lambda functions is improved. See SDK start time performance improvements.
- Version 2.x supports a new shorthand method for creating requests.

  Example

  ```
  dynamoDbClient.putItem(request -> request.tableName(TABLE))
  ```

For more details about the new features and to see specific code examples, refer to the other sections of this guide.

- Quick Start
- Setting up

- Code examples for the AWS SDK for Java 2.x
- Use the SDK
- Security for the AWS SDK for Java

How to migrate your code from AWS SDK for Java 1.x to 2.x

You can migrate your existing SDK for Java 1.x applications in a couple ways.

1. Automated approach by using the migration tool.
2. Manual approach by incrementally replacing 1.x imports with 2.x imports.

We recommend that you start by using the migration tool. It automates much of the routine, replacement work from 1.x to 2.x code.

Since the preview release of the tool doesn't migrate all features, you'll need to search for remaining v1 code after running the tool. When you find code that the tool didn't migrate, follow the step-by-step instructions (manual approach) and use the migration guide articles to finish the migration.

Topics

- Migration tool (preview release)
- Migration step-by-step instructions with example

Migration tool (preview release)

The AWS SDK for Java provides a migration tool that helps automate the migration of SDK for Java 1.x code to 2.x. The tool uses OpenRewrite—an open source, source code refactoring tool—to perform the migration.

You can use the tool now as a preview release. The tool supports all SDK service clients except for AmazonS3Client and high-level APIs such as TransferManager and DynamoDBMapper. The tool also has some limitations that are listed at the end of this topic.

Use the migration tool

Migrate a Maven project

Follow the instructions below to migrate your SDK for Java 1.x Maven-based project by using the OpenRewrite Maven plugin tool.

1. Navigate to your Maven project's root directory

   Open a terminal (command line) window and navigate to the root directory of your Maven-based application.

2. Run the plugin's `rewrite-maven-plugin` command

   You can choose from two modes (Maven goals): `dryRun` and `run`.

   `dryRun` mode

   In the `dryRun` mode, the plugin generates diff logs in the console output and a patch file named `rewrite.patch` in the `target/rewrite` folder. This mode allows you to preview the changes that would be made, since no changes are made to source code files.

   The following example show how to invoke the plugin in `dryRun` mode.

```
mvn org.openrewrite.maven:rewrite-maven-plugin:<rewrite-plugin-version>*:dryRun \
  -Drewrite.recipeArtifactCoordinates=software.amazon.awssdk:v2-
migration:<sdkversion>**-PREVIEW \
  -Drewrite.activeRecipes=software.amazon.awssdk.v2migration.AwsSdkJavaV1ToV2
```

   *Replace *`<rewrite-plugin-version>`* with the `rewriteMavenPluginVersion` value that you see in this test file.

   **Replace *`<sdkversion>`* with a 2.x SDK version. Visit Maven Central to check for the latest version.

   > **Important**
   >
   > Be sure to use the version of the `rewrite-maven-plugin` shown in the test file because other versions may not work.

Your console output from the dryRun mode should resemble the following output.

```

```

`run` mode

When you run the plugin in `run` mode, it modifies the source code on disk to apply the changes. Make sure you have a backup of the source code before running the command.

The following example show how to invoke the plugin in `run` mode.

```
mvn org.openrewrite.maven:rewrite-maven-plugin:<rewrite-plugin-version>*:run \
  -Drewrite.recipeArtifactCoordinates=software.amazon.awssdk:v2-
migration:<sdkversion>**-PREVIEW \
  -Drewrite.activeRecipes=software.amazon.awssdk.v2migration.AwsSdkJavaV1ToV2
```

*Replace *<rewrite-plugin-version>* with the `rewriteMavenPluginVersion`value that you see in this test file.

**Replace *<sdkversion>* with a 2.x SDK version. Visit Maven Central to check for the latest version.

After you run the command, compile your application and run tests to verify the changes.

Migrate a Gradle project

Follow the instructions below to migrate your SDK for Java 1.x Gradle-based project by using the OpenRewrite Gradle plugin tool.

1. Navigate to your Gradle project's root directory

   Open a terminal (command line) window and navigate to the root directory of your Gradle-based application.

2. Create a Gradle init script

   Create a `init.gradle` file with the following content in the directory.

```
initscript {
    repositories {
        maven { url "https://plugins.gradle.org/m2" }
    }
    dependencies {
        classpath("org.openrewrite:plugin:<rewrite-plugin-version>*")
    }
}

rootProject {
    plugins.apply(org.openrewrite.gradle.RewritePlugin)
    dependencies {
        rewrite("software.amazon.awssdk:v2-migration:latest.release")
    }

    afterEvaluate {
        if (repositories.isEmpty()) {
            repositories {
                mavenCentral()
            }
        }
    }
```

```
}
```

*Replace *<rewrite-plugin-version>* with the version that you see in this test file.

3. Run the `rewrite` command

   As with the Maven plugin, you can run the Gradle plugin in `dryRun` or `run` mode.

   `dryRun` mode

   The following example show how to invoke the plugin in `dryRun` mode.

```
gradle rewriteDryRun --init-script init.gradle \
  -Drewrite.activeRecipes=software.amazon.awssdk.v2migration.AwsSdkJavaV1ToV2
```

   `run` mode

   The following example show how to invoke the plugin in `run` mode.

```
gradle rewriteRun --init-script init.gradle \
  -Drewrite.activeRecipes=software.amazon.awssdk.v2migration.AwsSdkJavaV1ToV2
```

Current limitations

The current preview release doesn't support the migration of every feature in the V1 SDK. We are adding support for features incrementally.

If the tool cannot migrate a method or class from V1 to V2, the V2 output contains a comment that begins with:

```
/*AWS SDK for Java v2 migration: Transform for ...
```

Following the comment, the tool outputs a generic stub of the V2 version of the method or class. For example, in the following output, the migration tool attempted to migrate the V1 S3 client's `setBucketLifecycleConfiguration` method:

```
/*AWS SDK for Java v2 migration: Transform for setBucketLifecycleConfiguration method
 not supported.
Please manually migrate your code by using builder pattern, update from
 BucketLifecycleConfiguration.Rule
```

```
to LifecycleRule, StorageClass to TransitionStorageClass, and adjust imports and
 names.*/
s3.putBucketLifecycleConfiguration(
        PutBucketLifecycleConfigurationRequest.builder()
            .bucket(bucketName)
            .lifecycleConfiguration(BucketLifecycleConfiguration.builder()
                .build())
            .build());
```

The links in the list below, take you to migration information to help you manually migrate the code.

- the section called “S3 client differences”
- S3 Transfer Manager (TransferManager)
- DynamoDB object mapping (DynamoDBMapper)
- EC2 metadata utility (EC2MetadataUtils)
- Waiters (AmazonDynamoDBWaiters)
- IAM Policy Builder (Policy)
- CloudFront presigning (CloudFrontUrlSigner, CloudFrontCookieSigner)
- S3 Event Notifications (S3EventNotification)
- SDK metric publishing (1.x documentation, 2.x documentation)

Migration step-by-step instructions with example

This section provides a step-by-step guide to migrate your application that currently uses the SDK for Java v1.x to the SDK for Java 2.x. The first part presents an overview of the steps followed by a detailed example of a migration.

The steps that are covered here describe a migration of a normal use case, where the application calls AWS services using model-driven service clients. If you need to migrate code that uses higher level APIs such as S3 Transfer Manager or CloudFront presigning, refer to the section under the section called “What's different between 1.x and 2.x” table of contents.

The approach described here is a suggestion. You may use other techniques and leverage your IDE's code editing features to reach the same result.

Overview of steps

1. Begin by adding the SDK for Java 2.x BOM

By adding the Maven BOM (Bill of Materials) element for the SDK for Java 2.x to your POM file, you ensure that all of the v2 dependency you need are from the same version. Your POM can contain both v1 and v2 dependencies. This allows you to incrementally migrate your code rather than change it all at once.

SDK for Java 2.x BOM

```
<dependencyManagement>
  <dependencies>
    <dependency>
      <groupId>software.amazon.awssdk</groupId>
      <artifactId>bom</artifactId>
      <version>2.27.21</version>
      <type>pom</type>
      <scope>import</scope>
    </dependency>
  </dependencies>
</dependencyManagement>
```

You can find the latest version on the Maven Central Repository.

2. Search files for v1 class import statements

By scanning the files in your application for SERVICE_IDs used in v1 imports, you'll find the unique SERVICE_IDs used. A SERVICE_ID is a short, unique name for an AWS service. For example `cognitoidentity` is the SERVICE_ID for Amazon Cognito Identity.

3. Determine the v2 Maven dependencies from the v1 import statements

After you find all unique v1 SERVICE_IDs, you can determine the corresponding Maven artifact for the v2 dependency by referring to the section called “Package name to artifactId mappings”.

4. Add v2 dependency elements to the POM file

Update the Maven POM file with dependency elements determined in step 3.

5. In the Java files, incrementally change over the v1 classes to v2 classes

As you replace v1 classes with v2 classes, make the necessary changes to support the v2 API such as using builders instead of constructors and using fluent getters and setters.

6. Remove v1 Maven dependencies from the POM and v1 imports from files

After you migrate your code to use v2 classes, remove any leftover v1 imports from files and all dependencies from your build file.

7. Refactor the code to use v2 API enhancements

After the code successfully compiles and passes tests, you can take advantage of v2 enhancements such as using a different HTTP client or paginators to simplify code. This is an optional step.

Example migration

In this example, we migrate an application that uses the SDK for Java v1 and accesses several AWS services. We work through the following v1 method in detail in step 5. This is one method in a class that contains eight methods and there are 32 classes in the application.

v1 method to migrate

Only the v1 SDK imports are listed below from the Java file.

```
import com.amazonaws.ClientConfiguration;
import com.amazonaws.regions.Region;
import com.amazonaws.regions.RegionUtils;
import com.amazonaws.services.ec2.AmazonEC2Client;
import com.amazonaws.services.ec2.model.AmazonEC2Exception;
import com.amazonaws.services.ec2.model.CreateTagsRequest;
import com.amazonaws.services.ec2.model.DescribeInstancesRequest;
import com.amazonaws.services.ec2.model.DescribeInstancesResult;
import com.amazonaws.services.ec2.model.Instance;
import com.amazonaws.services.ec2.model.InstanceStateName;
import com.amazonaws.services.ec2.model.Reservation;
import com.amazonaws.services.ec2.model.Tag;
import com.amazonaws.services.ec2.model.TerminateInstancesRequest;
...
private static List<Instance> getRunningInstances(AmazonEC2Client ec2, List<String>
 instanceIds) {
    List<Instance> runningInstances = new ArrayList<>();
    try {
        DescribeInstancesRequest request = new DescribeInstancesRequest()
```

```
                .withInstanceIds(instanceIds);
        DescribeInstancesResult result;
        do {
            // DescribeInstancesResponse is a paginated response, so use tokens with
 multiple requests.
            result = ec2.describeInstances(request);
            request.setNextToken(result.getNextToken());   // Prepare request for next
 page.
            for (final Reservation r : result.getReservations()) {
                for (final Instance instance : r.getInstances()) {
                    LOGGER.info("Examining instanceId: "+ instance.getInstanceId());
                    // if instance is in a running state, add it to runningInstances
 list.
                    if (RUNNING_STATES.contains(instance.getState().getName())) {
                        runningInstances.add(instance);
                    }
                }
            }
        } while (result.getNextToken() != null);
    } catch (final AmazonEC2Exception exception) {
        // if instance isn't found, assume its terminated and continue.
        if (exception.getErrorCode().equals(NOT_FOUND_ERROR_CODE)) {
            LOGGER.info("Instance probably terminated; moving on.");
        } else {
            throw exception;
        }
    }
    return runningInstances;
}
```

1. Add v2 Maven BOM

Add the Maven BOM for the SDK for Java 2.x to the POM along side any other dependencies in the `dependencyManagement` section. If your POM file has the BOM for v1 of the SDK, leave it for now. It will be removed at a later step.

POM Dependency management at outset

```
<dependencyManagement>
  <dependencies>
    <dependency>
      <groupId>org.example</groupId>             <!--Existing dependency in POM. -->
      <artifactId>bom</artifactId>
```

```
      <version>1.3.4</version>
      <type>pom</type>
      <scope>import</scope>
    </dependency>
    ...
    <dependency>
      <groupId>com.amazonaws</groupId>
      <artifactId>aws-java-sdk-bom</artifactId>  <!--Existing v1 BOM dependency. -->
      <version>1.11.1000</version>
      <type>pom</type>
      <scope>import</scope>
    </dependency>
    ...
    <dependency>
      <groupId>software.amazon.awssdk</groupId>  <!--Add v2 BOM dependency. -->
      <artifactId>bom</artifactId>
      <version>2.27.21</version>
      <type>pom</type>
      <scope>import</scope>
    </dependency>
  </dependencies>
</dependencyManagement>
```

2. Search files for v1 class import statements

Search the application's code for unique occurrences of `import com.amazonaws.services`. This helps us determine the v1 dependencies used by the project. If your application has a Maven POM file with v1 dependencies listed, you can use this information instead.

For this example we use the [ripgrep (rg)] command to search the code base.

From the root of your code base, execute the following `ripgrep` command. After `ripgrep` finds the import statements, they are piped to the `cut`, `sort`, and `uniq` commands to isolate the SERVICE_IDs.

```
rg --no-filename 'import\s+com\.amazonaws\.services' | cut -d '.' -f 4 | sort | uniq
```

For this application, the following SERVICE_IDs are logged to the console.

```
autoscaling
cloudformation
ec2
```

```
identitymanagement
```

This indicates that there was at least one occurrence of each of the following package names used in `import` statements. For our purposes, the individual class names don't matter. We just need to find the SERVICE_IDs that are used.

```
com.amazonaws.services.autoscaling.*
com.amazonaws.services.cloudformation.*
com.amazonaws.services.ec2.*
com.amazonaws.services.identitymanagement.*
```

3. Determine the v2 Maven dependencies from the v1 import statements

The SERVICE_IDs for v1 that we isolated from Step 2—for example `autoscaling` and `cloudformation`—can be mapped to the same v2 SERVICE_ID for the most part. Since the v2 Maven artifactId matches the SERVICE_ID in most cases, you have the information you need to add dependency blocks to your POM file.

The following table shows how we can determine the v2 dependencies.

v1 SERVICE_ID maps to ... **package name**	**v2 SERVICE_ID maps to ...** **package name**	**v2 Maven dependency**

ec2
 	
`com.amazonaws.services. ec2.*`
	ec2
	
	`software.amazon.awssdk.services. ec2.*`
		`<dependency>`
		`  <groupId>software.amazon.awssdk</groupId>`
		`  <artifactId> ec2</artifactId>`
		`</dependency>`

autoscaling
 	
`com.amazonaws.services. autoscaling .*`
	autoscaling
	
	`software.amazon.awssdk.services. autoscaling .*`
		`<dependency>`
		`  <groupId>software.amazon.awssdk</groupId>`
		`  <artifactId> autoscaling </artifactId>`
		`</dependency>`

v1 SERVICE_ID maps to ... package name	v2 SERVICE_ID maps to ... package name	v2 Maven dependency

cloudformation
 	
`com.amazonaws.services.` **`cloudformation`** `.*`
	cloudformation
	
	`software.amazon.awssdk.` **`cloudformation`** `.*`
		`<dependency>`
		`  <groupId>software.amazon.awssdk</groupId>`
		`  <artifactId>` **`cloudformation`** `</artifactId>`
		`</dependency>`

identitymanagement*
 	
`com.amazonaws.services.` **`identitymanagement`** `.*`
	iam*
	
	`software.amazon.awssdk.` **`iam`**`.*`
		`<dependency>`
		`  <groupId>software.amazon.awssdk</groupId>`
		`  <artifactId>` **`iam`**`</artifactId>`
		`</dependency>`

* The `identitymanagement` to `iam` mapping is an exception where the SERVICE_ID differs between versions. Refer to the the section called “Package name to artifactId mappings” for exceptions if Maven or Gradle cannot resolve the v2 dependency.

4. Add v2 dependency elements to the POM file

In step 3, we determined the four dependency blocks that need to be added to the POM file. We don't need to add a version because we have specified the BOM in step 1. After the imports are added, our POM file has the following dependency elements.

```
  ...
<dependencies>
  ...
  <dependency>
    <groupId>software.amazon.awssdk</groupId>
    <artifactId>autoscaling</artifactId>
  </dependency>
  <dependency>
    <groupId>software.amazon.awssdk</groupId>
    <artifactId>iam</artifactId>
```

```
    </dependency>
    <dependency>
      <groupId>software.amazon.awssdk</groupId>
      <artifactId>cloudformation</artifactId>
    </dependency>
    <dependency>
      <groupId>software.amazon.awssdk</groupId>
      <artifactId>ec2</artifactId>
    </dependency>
    ...
  </dependencies>
    ...
```

5. In the Java files, incrementally change over the v1 classes to v2 classes

In the method that we are migrating, we see

- An EC2 service client from `com.amazonaws.services.ec2.AmazonEC2Client`.
- Several EC2 model classes used. For example `DescribeInstancesRequest` and `DescribeInstancesResult`.

```
import com.amazonaws.ClientConfiguration;
import com.amazonaws.regions.Region;
import com.amazonaws.regions.RegionUtils;
import com.amazonaws.services.ec2.AmazonEC2Client;
import com.amazonaws.services.ec2.model.AmazonEC2Exception;
import com.amazonaws.services.ec2.model.CreateTagsRequest;
import com.amazonaws.services.ec2.model.DescribeInstancesRequest;
import com.amazonaws.services.ec2.model.DescribeInstancesResult;
import com.amazonaws.services.ec2.model.Instance;
import com.amazonaws.services.ec2.model.InstanceStateName;
import com.amazonaws.services.ec2.model.Reservation;
import com.amazonaws.services.ec2.model.Tag;
import com.amazonaws.services.ec2.model.TerminateInstancesRequest;
...
private static List<Instance> getRunningInstances(AmazonEC2Client ec2, List<String>
 instanceIds)
    List<Instance> runningInstances = new ArrayList<>();
    try {
        DescribeInstancesRequest request = new DescribeInstancesRequest()
                .withInstanceIds(instanceIds);
        DescribeInstancesResult result;
```

```
        do {
            // DescribeInstancesResponse is a paginated response, so use tokens with
 multiple re
            result = ec2.describeInstances(request);
            request.setNextToken(result.getNextToken());   // Prepare request for next
 page.
            for (final Reservation r : result.getReservations()) {
                for (final Instance instance : r.getInstances()) {
                    LOGGER.info("Examining instanceId: "+ instance.getInstanceId());
                    // if instance is in a running state, add it to runningInstances
 list.
                    if (RUNNING_STATES.contains(instance.getState().getName())) {
                        runningInstances.add(instance);
                    }
                }
            }
        } while (result.getNextToken() != null);
    } catch (final AmazonEC2Exception exception) {
        // if instance isn't found, assume its terminated and continue.
        if (exception.getErrorCode().equals(NOT_FOUND_ERROR_CODE)) {
            LOGGER.info("Instance probably terminated; moving on.");
        } else {
            throw exception;
        }
    }
    return runningInstances;
}
...
```

Our goal is to replace all v1 imports with v2 imports. We proceed one class at a time.

a. Replace import statement or class name

We see that the first parameter to the `describeRunningInstances` method is a v1 `AmazonEC2Client` instance. Do one of the following:

- Replace the import for `com.amazonaws.services.ec2.AmazonEC2Client` with `software.amazon.awssdk.services.ec2.Ec2Client` and change `AmazonEC2Client` to `Ec2Client`.
- Change the parameter type to `Ec2Client` and let the IDE prompt us for the correct import. Our IDE will prompt us to import the v2 class because the client names differ—`AmazonEC2Client` and `Ec2Client`. This approach does not work if the class name is the same in both versions.

b. Replace v1 model classes with v2 equivalents

After the change to the v2 `Ec2Client`, if we use an IDE, we see compilation errors in the following statement.

```
result = ec2.describeInstances(request);
```

The compilation error results from using an instance of v1's `DescribeInstancesRequest` as a parameter to the v2 `Ec2Client` `describeInstances` method. To fix, make the following replacement or import statements.

replace	with
`import com.amazonaws.services.ec2.model.DescribeInstancesRequest`	`import software.amazon.awssdk.services.ec2.model.DescribeInstancesRequest`

c. Change v1 constructors to v2 builders.

We still see compilation errors because there are no constructors on v2 classes. To fix, make the following change.

change	to

`final DescribeInstancesRequest request = new DescribeInstancesRequest()`
`.withInstanceIds(instanceIdsCopy);`
	`final DescribeInstancesRequest request = DescribeInstancesRequest.builder()`
	`.instanceIds(instanceIdsCopy)`
	`.build();`

d. Replace v1 `*Result` response objects with v2 `*Response` equivalents

A consistent difference between v1 and v2 is that all response objects in v2 end with `*Response` instead of `*Result`. Replace the v1 `DescribeInstancesResult` import to the v2 import, `DescribeInstancesResponse`.

d. Make API changes

The following statement needs a few changes.

```
request.setNextToken(result.getNextToken());
```

In v2, setter methods do not use the `set` or with `prefix`. Getter methods prefixed with `get` are also gone in the SDK for Java 2.x

Model classes, such as the `request` instance, are immutable in v2, so we need to create a new `DescribeInstancesRequest` with a builder.

In v2, the statement becomes the following.

```
request = DescribeInstancesRequest.builder()
        .nextToken(result.nextToken())
        .build();
```

d. Repeat until method compiles with v2 classes

Continue with the rest of the code. Replace v1 imports with v2 imports and fix the compilation errors. Refer to the v2 API Reference and What's different reference as needed.

After we migrate this single method, we have the following v2 code.

```
import com.amazonaws.ClientConfiguration;
import com.amazonaws.regions.Region;
import com.amazonaws.regions.RegionUtils;
import com.amazonaws.services.ec2.AmazonEC2Client;
import com.amazonaws.services.ec2.model.AmazonEC2Exception;
import com.amazonaws.services.ec2.model.CreateTagsRequest;
import com.amazonaws.services.ec2.model.InstanceStateName;
import com.amazonaws.services.ec2.model.Tag;
import com.amazonaws.services.ec2.model.TerminateInstancesRequest;

import software.amazon.awssdk.services.ec2.Ec2Client;
import software.amazon.awssdk.services.ec2.model.DescribeInstancesRequest;
import software.amazon.awssdk.services.ec2.model.DescribeInstancesResponse;
import software.amazon.awssdk.services.ec2.model.Ec2Exception;
import software.amazon.awssdk.services.ec2.model.Instance;
import software.amazon.awssdk.services.ec2.model.Reservation;
...
```

```
private static List<Instance> getRunningInstances(Ec2Client ec2, List<String>
 instanceIds) {
    List<Instance> runningInstances = new ArrayList<>();
        try {
            DescribeInstancesRequest request = DescribeInstancesRequest.builder()
                    .instanceIds(instanceIds)
                    .build();
            DescribeInstancesResponse result;
            do {
                // DescribeInstancesResponse is a paginated response, so use tokens
 with multiple re
                result = ec2.describeInstances(request);
                request = DescribeInstancesRequest.builder()   // Prepare request for
 next page.
                        .nextToken(result.nextToken())
                        .build();
                for (final Reservation r : result.reservations()) {
                    for (final Instance instance : r.instances()) {
                        // if instance is in a running state, add it to
 runningInstances list.
                        if (RUNNING_STATES.contains(instance.state().nameAsString())) {
                            runningInstances.add(instance);
                        }
                    }
                }
            } while (result.nextToken() != null);
        } catch (final Ec2Exception exception) {
            // if instance isn't found, assume its terminated and continue.
            if (exception.awsErrorDetails().errorCode().equals(NOT_FOUND_ERROR_CODE)) {
                    LOGGER.info("Instance probably terminated; moving on.");
            } else {
                throw exception;
            }
        }
        return runningInstances;
    }
...
```

Because we are migrating a single method in a Java file with eight methods, we have a mix of v1 and v2 imports as we work through the file. We added the last six import statements as we performed the steps.

After we migrate all the code, there will be no more v1 import statements.

6. Remove v1 Maven dependencies from the POM and v1 imports from files

After we migrate all v1 code in the file, we have the following v2 SDK import statements.

```
import software.amazon.awssdk.core.client.config.ClientOverrideConfiguration;
import software.amazon.awssdk.regions.Region;
import software.amazon.awssdk.regions.ServiceMetadata;
import software.amazon.awssdk.services.ec2.Ec2Client;
import software.amazon.awssdk.services.ec2.model.CreateTagsRequest;
import software.amazon.awssdk.services.ec2.model.DescribeInstancesRequest;
import software.amazon.awssdk.services.ec2.model.DescribeInstancesResponse;
import software.amazon.awssdk.services.ec2.model.Ec2Exception;
import software.amazon.awssdk.services.ec2.model.Instance;
import software.amazon.awssdk.services.ec2.model.InstanceStateName;
import software.amazon.awssdk.services.ec2.model.Reservation;
import software.amazon.awssdk.services.ec2.model.Tag;
import software.amazon.awssdk.services.ec2.model.TerminateInstancesRequest;
```

After we migrate *all* files in our application, we no longer need the v1 dependencies in our POM file. Remove the v1 BOM from the `dependencyManagement` section, if using, and all v1 dependency blocks.

7. Refactor the code to use v2 API enhancements

For the snippet we have been migrating, we can optionally use a v2 paginator and let the SDK manage the token-based requests for more data.

We can replace the entire do clause with the following.

```
                DescribeInstancesIterable responses =
ec2.describeInstancesPaginator(request);

                responses.reservations().stream()
                        .forEach(reservation -> reservation.instances()
                                .forEach(instance -> {
                                    if
(RUNNING_STATES.contains(instance.state().nameAsString())) {
                                        runningInstances.put(instance.instanceId(),
instance);
                                    }
                                }));
```

Package name to Maven artifactId mappings

When you migrate your Maven or Gradle project from v1 of the SDK for Java to v2, you need to figure out which dependencies to add to your build file. The approach described in the the section called “Step-by-step instructions” (step 3) uses the package names in import statements as a starting point to determine the dependencies (as artifactIds) to add to your build file.

You can use the information in this topic to map the v1 package names to v2 artifactIds.

Common naming convention used in package names and Maven artifactIds

The following table shows the common naming convention that the SDKs use for a given SERVICE_ID. A SERVICE_ID is a unique identifier for an AWS service. For example, the SERVICE_ID for the Amazon S3 service is `s3` and `cognitoidentity` is the SERVICE_ID for Amazon Cognito Identity.

v1 package name (import statement)	v1 artifactId	v2 artifactId	v2 package name (import statement)
com.amazonaws.services.SERVICE_ID	aws-java-sdk-SERVICE_ID	SERVICE_ID	software.amazon.awssdk.services.SERVICE_ID
Example for Amazon Cognito Identity (SERVICE_ID: `cognitoidentity`)			
com.amazonaws.services.***cognitoidentity***	aws-java-sdk-***cognitoidentity***	***cognitoidentity***	software.amazon.awssdk.services.***cognitoidentity***

SERVICE_ID differences

Within v1

In some cases the SERVICE_ID differs between the package name and in the artifactId for the same service. For example, the CloudWatch Metrics row of the following table shows that `metrics` is the SERVICE_ID in the package name but `cloudwatchmetrics` is the artifactId's SERVICE_ID.

Within v2

There are no differences in the SERVICE_ID used in package names and artifactIds.

Between v1 and v2

For the majority of services, the SERVICE_ID in v2 is the same as v1's SERVICE_ID in both package names and artifactIds. An example of this is the `cognitoedentity` SERVICE_ID as shown in the previous table. However, some SERVICE_IDs differ between the SDKs as shown in the following table.

A **boldface SERVICE_ID** in either of the v1 columns indicates that it's different from the SERVICE_ID used in v2.

Service name	v1 package name	v1 artifactId	v2 artifactId	v2 package name
	All package names begin with `com.amazonaws.services` as shown in the first row.	All artifactIds are enclosed in tags as shown in the first row.	All artifactIds are enclosed in tags as shown in the first row.	All package names begin with `software.amazon.awssdk` as shown in the first row.
API Gateway	com.amazonaws.services.apigateway	<artifactId>aws-java-sdk-**api-gateway**</artifactId>	<artifactId>apigateway</artifactId>	software.amazon.awssdk.services.apigateway

Step Functions	**stepfunctions**	**stepfunctions**	sfn	sfn

What's different between the AWS SDK for Java 1.x and 2.x

This section describes the main changes to be aware of when converting an application from using the AWS SDK for Java version 1.x to version 2.x.

Package name change

A noticeable change from the SDK for Java 1.x to the SDK for Java 2.x is the package name change. Package names begin with `software.amazon.awssdk` in SDK 2.x, whereas the SDK 1.x uses `com.amazonaws`.

These same names differentiate Maven artifacts from SDK 1.x to SDK 2.x. Maven artifacts for the SDK 2.x use the `software.amazon.awssdk` groupId, whereas the SDK 1.x uses the `com.amazonaws` groupId.

There are a few times when your code requires a `com.amazonaws` dependency for a project that otherwise uses only SDK 2.x artifacts. One example of this is when you work with server-side AWS Lambda. This was shown in the Set up an Apache Maven project section earlier in this guide.

> **Note**
>
> Several package names in the SDK 1.x contain `v2`. The use of `v2` in this case usually means that code in the package is targeted to work with version 2 of the service.
> Since the full package name begins with `com.amazonaws`, these are SDK 1.x components. Examples of these package names in the SDK 1.x are:

- `com.amazonaws.services.dynamodbv2`
- `com.amazonaws.retry.v2`
- `com.amazonaws.services.apigatewayv2`
- `com.amazonaws.services.simpleemailv2`

Adding version 2.x to your project

Maven is the recommended way to manage dependencies when using the AWS SDK for Java 2.x. To add version 2.x components to your project, update your `pom.xml` file with a dependency on the SDK.

Example

```
<dependencyManagement>
    <dependencies>
        <dependency>
          <groupId>software.amazon.awssdk</groupId>
          <artifactId>bom</artifactId>
          <version>2.27.21</version>
          <type>pom</type>
          <scope>import</scope>
        </dependency>
    </dependencies>
</dependencyManagement>

<dependencies>
    <dependency>
      <groupId>software.amazon.awssdk</groupId>
      <artifactId>dynamodb</artifactId>
    </dependency>
</dependencies>
```

You can also use version 1.x and 2.x side-by-side as you migrate your project to version 2.x.

Immutable POJOs

Clients and operation request and response objects are now immutable and cannot be changed after creation. To reuse a request or response variable, you must build a new object to assign to it.

Example of updating a request object in 1.x

```
DescribeAlarmsRequest request = new DescribeAlarmsRequest();
DescribeAlarmsResult response = cw.describeAlarms(request);

request.setNextToken(response.getNextToken());
```

Example of updating a request object in 2.x

```
DescribeAlarmsRequest request = DescribeAlarmsRequest.builder().build();
DescribeAlarmsResponse response = cw.describeAlarms(request);

request = DescribeAlarmsRequest.builder()
        .nextToken(response.nextToken())
        .build();
```

Setter and getter methods

In the AWS SDK for Java 2.x, setter method names don't include the `set` or `with` prefix. For example, `*.withEndpoint()` is now `*.endpoint()`.

Getter method names do not use the `get` prefix.

Example of using setter methods in 1.x

```
AmazonDynamoDB client = AmazonDynamoDBClientBuilder.standard()
          .withRegion("us-east-1")
          .build();
```

Example of using setter methods in 2.x

```
DynamoDbClient client = DynamoDbClient.builder()
          .region(Region.US_EAST_1)
          .build();
```

Example of using getter methods in 1.x

```
String token = request.getNextToken();
```

Example of using getter methods in 2.x

```
String token = request.nextToken();
```

Model class names

Model class names that represent service responses end with `Response` in v2 instead of `Result` that v1 uses.

Example of class names that represent a response in v1

```
CreateApiKeyResult
AllocateAddressResult
```

Example of class names that represent a response in v2

```
CreateApiKeyResponse
AllocateAddressResponse
```

Migration status of libraries and utilities

SDK for Java libraries and utilities

The following table lists the migration status of libraries and utilities for the SDK for Java.

Version 1.12.x name	Version 2.x name	Since version in 2.x
DynamoDBMapper	DynamoDbEnhancedClient	2.12.0
Waiters	Waiters	2.15.0
CloudFrontUrlSigner, CloudFrontCookieSigner	CloudFrontUtilities	2.18.33
TransferManager	S3TransferManager	2.19.0
EC2 Metadata client	EC2 Metadata client	2.19.29
S3 URI parser	S3 URI parser	2.20.41

Version 1.12.x name	Version 2.x name	Since version in 2.x
IAM Policy Builder	IAM Policy Builder	2.20.126
S3 Event Notifications	S3 Event Notifications	2.25.11
Amazon SQS Client-side Buffering	Automatic Request Batching API for Amazon SQS	2.28.0
Progress Listeners	Progress Listeners	not yet released

Related libraries

The following table lists libraries that are released separately but work with the SDK for Java 2.x.

Name used with version 2.x of the SDK for Java	Since version
Amazon S3 Encryption Client	3.0.0[1]
AWS Database Encryption Client for DynamoDB	3.0.0[2]

[1]The encryption client for Amazon S3 is available by using the following Maven dependency.

```
<dependency>
    <groupId>software.amazon.encryption.s3</groupId>
    <artifactId>amazon-s3-encryption-client-java</artifactId>
    <version>3.x</version>
</dependency>
```

[2]The AWS Database Encryption Client for DynamoDB is available by using the following Maven dependency.

```
<dependency>
    <groupId>software.amazon.cryptography</groupId>
    <artifactId>aws-database-encryption-sdk-dynamodb</artifactId>
    <version>3.x</version>
```

```
</dependency>
```

Migration details for libraries and utilities

- Transfer Manager
- EC2 metadata utility
- CloudFront presigning
- S3 URI parsing
- DynamoDB mapping/document APIs
- IAM Policy Builder
- S3 Event Notifications
- SDK metric publishing (1.x documentation, 2.x documentation)

Client changes

Client builders

You must create all clients using the client builder method. Constructors are no longer available.

Example of creating a client in version 1.x

```
AmazonDynamoDB ddbClient = AmazonDynamoDBClientBuilder.defaultClient();
AmazonDynamoDBClient ddbClient = new AmazonDynamoDBClient();
```

Example of creating a client in version 2.x

```
DynamoDbClient ddbClient = DynamoDbClient.create();
DynamoDbClient ddbClient = DynamoDbClient.builder().build();
```

Client class names

All client class names are now fully camel cased and no longer prefixed by `Amazon`. These changes are aligned with names used in the AWS CLI.

Example of class names in 1.x

```
AmazonDynamoDB
AWSACMPCAAsyncClient
```

Example of class names in 2.x

```
DynamoDbClient
AcmAsyncClient
```

Client class name changes

1.x Client	2.x Client
com.amazonaws.services.acmpca.AWSACMPCAAsyncClient	software.amazon.awssdk.services.acm.AcmAsyncClient
com.amazonaws.services.acmpca.AWSACMPCAClient	software.amazon.awssdk.services.acm.AcmClient
com.amazonaws.services.alexaforbusiness.AmazonAlexaForBusinessAsyncClient	software.amazon.awssdk.services.alexaforbusiness.AlexaForBusinessAsyncClient
com.amazonaws.services.alexaforbusiness.AmazonAlexaForBusinessClient	software.amazon.awssdk.services.alexaforbusiness.AlexaForBusinessClient
com.amazonaws.services.apigateway.AmazonApiGatewayAsyncClient	software.amazon.awssdk.services.apigateway.ApiGatewayAsyncClient
com.amazonaws.services.apigateway.AmazonApiGatewayClient	software.amazon.awssdk.services.apigateway.ApiGatewayClient
com.amazonaws.services.applicationautoscaling.AWSApplicationAutoScalingAsyncClient	software.amazon.awssdk.services.applicationautoscaling.ApplicationAutoScalingAsyncClient
com.amazonaws.services.applicationautoscaling.AWSApplicationAutoScalingClient	software.amazon.awssdk.services.applicationautoscaling.ApplicationAutoScalingClient

1.x Client	2.x Client
com.amazonaws.services.applicationdiscovery.AWSApplicationDiscoveryAsyncClient	software.amazon.awssdk.services.applicationdiscovery.ApplicationDiscoveryAsyncClient
com.amazonaws.services.applicationdiscovery.AWSApplicationDiscoveryClient	software.amazon.awssdk.services.applicationdiscovery.ApplicationDiscoveryClient
com.amazonaws.services.appstream.AmazonAppStreamAsyncClient	software.amazon.awssdk.services.appstream.AppStreamAsyncClient
com.amazonaws.services.appstream.AmazonAppStreamClient	software.amazon.awssdk.services.appstream.AppStreamClient
com.amazonaws.services.appsync.AWSAppSyncAsyncClient	software.amazon.awssdk.services.appsync.AppSyncAsyncClient
com.amazonaws.services.appsync.AWSAppSyncClient	software.amazon.awssdk.services.appsync.AppSyncClient
com.amazonaws.services.athena.AmazonAthenaAsyncClient	software.amazon.awssdk.services.athena.AthenaAsyncClient
com.amazonaws.services.athena.AmazonAthenaClient	software.amazon.awssdk.services.athena.AthenaClient
com.amazonaws.services.autoscaling.AmazonAutoScalingAsyncClient	software.amazon.awssdk.services.autoscaling.AutoScalingAsyncClient
com.amazonaws.services.autoscaling.AmazonAutoScalingClient	software.amazon.awssdk.services.autoscaling.AutoScalingClient

1.x Client	2.x Client
com.amazonaws.services.autoscalingplans.AWSAutoScalingPlansAsyncClient	software.amazon.awssdk.services.autoscalingplans.AutoScalingPlansAsyncClient
com.amazonaws.services.autoscalingplans.AWSAutoScalingPlansClient	software.amazon.awssdk.services.autoscalingplans.AutoScalingPlansClient
com.amazonaws.services.batch.AWSBatchAsyncClient	software.amazon.awssdk.services.batch.BatchAsyncClient
com.amazonaws.services.batch.AWSBatchClient	software.amazon.awssdk.services.batch.BatchClient
com.amazonaws.services.budgets.AWSBudgetsAsyncClient	software.amazon.awssdk.services.budgets.BudgetsAsyncClient
com.amazonaws.services.budgets.AWSBudgetsClient	software.amazon.awssdk.services.budgets.BudgetsClient
com.amazonaws.services.certificatemanager.AWSCertificateManagerAsyncClient	software.amazon.awssdk.services.acm.AcmAsyncClient
com.amazonaws.services.certificatemanager.AWSCertificateManagerClient	software.amazon.awssdk.services.acm.AcmClient
com.amazonaws.services.cloud9.AWSCloud9AsyncClient	software.amazon.awssdk.services.cloud9.Cloud9AsyncClient
com.amazonaws.services.cloud9.AWSCloud9Client	software.amazon.awssdk.services.cloud9.Cloud9Client
com.amazonaws.services.clouddirectory.AmazonCloudDirectoryAsyncClient	software.amazon.awssdk.services.clouddirectory.CloudDirectoryAsyncClient

1.x Client	2.x Client

Client creation defaults

In version 2.x, the following changes have been made to the default client creation logic.

- The default credential provider chain for S3 no longer includes anonymous credentials. You must manually specify anonymous access to S3 by using the `AnonymousCredentialsProvider`.
- The following environment variables related to default client creation are different.

1.x	2.x
`AWS_CBOR_DISABLED`	`CBOR_ENABLED`
`AWS_ION_BINARY_DISABLE`	`BINARY_ION_ENABLED`

- The following system properties related to default client creation are different.

1.x	2.x
`com.amazonaws.sdk.disableEc2Metadata`	`aws.disableEc2Metadata`
`com.amazonaws.sdk.ec2MetadataServiceEndpointOverride`	`aws.ec2MetadataServiceEndpoint`
`com.amazonaws.sdk.disableCbor`	`aws.cborEnabled`
`com.amazonaws.sdk.disableIonBinary`	`aws.binaryIonEnabled`

- Version 2.x does not support the following system properties.
-

1.x
`com.amazonaws.sdk.disableCertChecking`
`com.amazonaws.sdk.enableDefaultMetrics`
`com.amazonaws.sdk.enableThrottledRetry`
`com.amazonaws.regions.RegionUtils.fileOverride`
`com.amazonaws.regions.RegionUtils.disableRemote`
`com.amazonaws.services.s3.disableImplicitGlobalClients`

1.x
`com.amazonaws.sdk.enableInRegionOptimizedMode`

- Loading Region configuration from a custom `endpoints.json` file is no longer supported.

Client configuration

In 1.x, SDK client configuration was modified by setting a `ClientConfiguration` instance on the client or client builder. In version 2.x, the client configuration is split into separate configuration classes. With the separate configuration classes, you can configure different HTTP clients for async versus synchronous clients but still use the same `ClientOverrideConfiguration` class.

Example of client configuration in version 1.x

```
AmazonDynamoDBClientBuilder.standard()
.withClientConfiguration(clientConfiguration)
.build()
```

Example of synchronous client configuration in version 2.x

```
ProxyConfiguration.Builder proxyConfig = ProxyConfiguration.builder();

ApacheHttpClient.Builder httpClientBuilder =
        ApacheHttpClient.builder()
                        .proxyConfiguration(proxyConfig.build());

ClientOverrideConfiguration.Builder overrideConfig =
        ClientOverrideConfiguration.builder();

DynamoDbClient client =
        DynamoDbClient.builder()
                      .httpClientBuilder(httpClientBuilder)
                      .overrideConfiguration(overrideConfig.build())
                      .build();
```

Example of asynchronous client configuration in version 2.x

```
NettyNioAsyncHttpClient.Builder httpClientBuilder =
        NettyNioAsyncHttpClient.builder();
```

```
ClientOverrideConfiguration.Builder overrideConfig =
        ClientOverrideConfiguration.builder();

ClientAsyncConfiguration.Builder asyncConfig =
        ClientAsyncConfiguration.builder();

DynamoDbAsyncClient client =
        DynamoDbAsyncClient.builder()
                           .httpClientBuilder(httpClientBuilder)
                           .overrideConfiguration(overrideConfig.build())
                           .asyncConfiguration(asyncConfig.build())
                           .build();
```

HTTP clients

Notable changes

- In version 2.x, you can change which HTTP client to use at runtime by specifying an implementation using `clientBuilder.httpClientBuilder`.
- When you pass an HTTP client by using `clientBuilder.httpClient` to a service client builder, the HTTP client is not closed by default if the service client closes. This allows you to share HTTP clients between service clients.
- Asynchronous HTTP clients now use non-blocking IO.
- Some operations now use HTTP/2 for improved performance.

Settings changes

Setting	1.x	2.x Sync, Apache	2.x Async, Netty
	`ClientConfiguration clientConfig = new ClientConfiguration()`	`ApacheHttpClient.Builder httpClientBuilder = ApacheHttpClient.builder()`	`NettyNioAsyncHttpClient.Builder httpClientBuilder = NettyNioAsyncHttpClient.builder()`

Response metadata cache size	`clientConfig.setResponseMetadataCacheSize(...)` `clientConfig.withResponseMetadataCacheSize(...)`	Not Supported (Request Feature)

Setting	1.x	2.x
DNS resolver	`clientConfig.setDnsResolver(...)` `clientConfig.withDnsResolver(...)`	Not Supported (Request Feature)

TCP keepalive	`clientConfig.setUseTcpKeepAlive(...)`
	`clientConfig.withTcpKeepAlive(...)`
		This option is now in the HTTP Client configuration
		`- ApacheHttpClient.builder().tcpKeepAlive(true)`
		`- NettyNioAsyncHttpClient.builder().tcpKeepAlive(true)`

Secure random	`clientConfig.setSecureRandom(...)` `clientConfig.withSecureRandom(...)`	Not Supported (Request Feature)

	`AmazonDynamoDBClientBuilder.standard()`
	`.withClientConfiguration(clientConfiguration)`
	`.build()`
		`DynamoDbClient.builder()`
		`.overrideConfiguration(overrideConfig.build())`
		`.build()`

Client override retries

Setting	1.x	2.x
	`ClientConfiguration clientConfig =` `new ClientConfiguration()`	`ClientOverrideConfiguration.Builder overrideConfigBuilder =`

Setting	1.x	2.x
		`ClientOverrideConfiguration.builder();`
Max error retry	`clientConfig.setMaxErrorRetry(...)` `clientConfig.withMaxErrorRetry(...)`	`// Configure the default retry strategy.` `overrideConfigBuilder.retryStrategy(b -> b.maxAttempts(...));`
Use throttled retries	`clientConfig.setUseThrottleRetries(...)` `clientConfig.withUseThrottleRetries(...)`	Not supported
Max consecutive retries before throttling	`clientConfig.setMaxConsecutiveRetriesBeforeThrottling(...)` `clientConfig.withMaxConsecutiveRetriesBeforeThrottling(...)`	Not supported

Setting	1.x	2.x

	`AmazonDynamoDBClientBuilder.standard()`
	`    .withClientConfiguration(clientConfiguration)`
	`    .build()`
		`DynamoDbClient.builder()`
		`        .overrideConfiguration(overrideConfigBuilder.build())`
		`        .build();`
		
		`// You also have the option to use a lambda expression to configure and`
		`// build the 'ClientOverrideConfiguration.Builder'.`
		`DynamoDbClient client = DynamoDbClient.builder()`
		`        .overrideConfiguration(o -> o.retryStrategy(b -> b.maxAttempts(5)))`
		`        .build();`

Asynchronous clients

Setting	1.x	2.x
		`ClientAsyncConfiguration.Builder asyncConfig = ClientAsyncConfiguration.builder()`
Executor	`AmazonDynamoDBAsyncClientBuilder.standard()`	`asyncConfig.advancedOption(`

Setting	1.x	2.x
	`.withExecutorFactory(...)` `.build()`	`SdkAdvancedAsyncClientOption.FUTURE_COMPLETION_EXECUTOR, ...)`

		`DynamoDbAsyncClient.builder()`
		`.asyncConfiguration(asyncConfig)`
		`.build()`

Other client changes

The following `ClientConfiguration` option from 1.x has changed in 2.x of the SDK and doesn't have a direct equivalent.

Setting	1.x	2.x equivalent

Protocol	`clientConfig.setProtocol(Protocol.HTTP)`
	`clientConfig.withProtocol(Protocol.HTTP)`
		The protocol setting is HTTPS by default. To modify the setting, specify the protocol setting an HTTP endpoint on the client builder:
		`clientBuilder.endpointOverride(`
		`URI.create("http://..."))`

Credentials provider changes

This section provides a mapping of the name changes of credentials provider classes and methods between versions 1.x and 2.x of the AWS SDK for Java.

Notable differences

- The default credentials provider loads system properties before environment variables in version 2.x. For more information, see Using credentials.
- The constructor method is replaced with the `create` or `builder` methods.

  Example

```
DefaultCredentialsProvider.create();
```

- Asynchronous refresh is no longer set by default. You must specify it with the `builder` of the credentials provider.

  Example

```
ContainerCredentialsProvider provider = ContainerCredentialsProvider.builder()
          .asyncCredentialUpdateEnabled(true)
          .build();
```

- You can specify a path to a custom profile file using the `ProfileCredentialsProvider.builder()`.

  Example

```
ProfileCredentialsProvider profile = ProfileCredentialsProvider.builder()

 .profileFile(ProfileFile.builder().content(Paths.get("myProfileFile.file")).build())
          .build();
```

- Profile file format has changed to more closely match the AWS CLI. For details, see Configuring the AWS CLI in the *AWS Command Line Interface User Guide*.

Credentials provider changes mapped between versions 1.x and 2.x

`AWSCredentialsProvider`

Change category	1.x	2.x
Package/class name	`com.amazonaws.auth.AWSCredentialsProvider`	`software.amazon.awssdk.auth.credentials.AwsCredentialsProvider`
Method name	`getCredentials`	`resolveCredentials`
Unsupported method	`refresh`	Not supported

`DefaultAWSCredentialsProviderChain`

Change category	1.x	2.x
Package/class name	`com.amazonaws.auth.DefaultAWSCredentialsProviderChain`	`software.amazon.awssdk.auth.credentials.DefaultCredentialsProvider`
Creation	`new DefaultAWSCredentialsProviderChain`	`DefaultCredentialsProvider.create`
Unsupported method	`getInstance`	Not supported
Priority order of external settings	Environment variables before system properties	System properties before environment variables

`AWSStaticCredentialsProvider`

Change category	1.x	2.x
Package/class name	`com.amazonaws.auth.AWSStaticCredentialsProvider`	`software.amazon.awssdk.auth.credentials.StaticCredentialsProvider`
Creation	`new AWSStaticCredentialsProvider`	`StaticCredentialsProvider.create`

`EnvironmentVariableCredentialsProvider`

Change category	1.x	2.x
Package/class name	`com.amazonaws.auth.EnvironmentVariableCredentialsProvider`	`software.amazon.awssdk.auth.credentials.EnvironmentVariableCredentialsProvider`
Creation	`new EnvironmentVariableCredentialsProvider`	`EnvironmentVariableCredentialsProvider.create`
Environment variable name	`AWS_ACCESS_KEY`	`AWS_ACCESS_KEY_ID`
	`AWS_SECRET_KEY`	`AWS_SECRET_ACCESS_KEY`

`SystemPropertiesCredentialsProvider`

Change category	1.x	2.x
Package/class name	`com.amazonaws.auth.SystemPropertiesCredentialsProvider`	`software.amazon.awssdk.auth.credentials.SystemPropertyCredentialsProvider`
Creation	`new SystemPropertiesCredentialsProvider`	`SystemPropertiesCredentialsProvider.create`
System property name	`aws.secretKey`	`aws.secretAccessKey`

`ProfileCredentialsProvider`

Change category	1.x	2.x
Package/class name	`com.amazonaws.auth.profile.ProfileCredentialsProvider`	`software.amazon.awssdk.auth.credentials.ProfileCredentialsProvider`
Creation	`new ProfileCredentialsProvider`	`ProfileCredentialsProvider.create`
Location of custom profile	• `AWS_CREDENTIAL_PROFILES_FILE` environment variable • `new ProfileCredentialsProvider`	• `AWS_SHARED_CREDENTIALS_FILE` environment variable • `ProfileCredentialsProvider.builder`

`ContainerCredentialsProvider`

Change category	1.x	2.x
Package/class name	`com.amazonaws.auth.ContainerCredentialsProvider`	`software.amazon.awssdk.auth.credentials.ContainerCredentialsProvider`
Creation	`new ContainerCredentialsProvider`	`ContainerCredentialsProvider.create`
Specify asynchronous refresh	Not supported	Default behavior

`InstanceProfileCredentialsProvider`

Change category	1.x	2.x
Package/class name	`com.amazonaws.auth.InstanceProfileCredentialsProvider`	`software.amazon.awssdk.auth.credentials.InstanceProfileCredentialsProvider`
Creation	`new InstanceProfileCredentialsProvider`	`InstanceProfileCredentialsProvider.create`
Specify asynchronous refresh	`new InstanceProfileCredentialsProvider(true)`	`InstanceProfileCredentialProvider.builder().asyncCredentialUpdateEnabled(true).build()`
System property name	`com.amazonaws.sdk.disableEc2Metadata`	`aws.disableEc2Metadata`

Change category	1.x	2.x
	`com.amazonaws.sdk.ec2MetadataServiceEndpointOverride`	`aws.ec2MetadataServiceEndpoint`

`STSAssumeRoleSessionCredentialsProvider`

Change category	1.x	2.x
Package/class name	`com.amazonaws.auth.STSAssumeRoleSessionCredentialsProvider`	`software.amazon.awssdk.services.sts.auth.StsAssumeRoleCredentialsProvider`
Creation	• `new STSAssumeRoleSessionCredentialsProvider` • `new STSAssumeRoleSessionCredentialsProvider.Builder`	`StsAssumeRoleCredentialsProvider.builder`
Asynchronous refresh	Default behavior	Default behavior
Configuration	`new STSAssumeRoleSessionCredentialsProvider.Builder`	Configure a `StsClient` and `AssumeRoleRequest` request

`STSSessionCredentialsProvider`

Change category	1.x	2.x
Package/class name	`com.amazonaws.auth.STSSessionCredentialsProvider`	`software.amazon.awssdk.services.sts.auth.StsGetSessionTokenCredentialsProvider`
Creation	`new STSSessionCredentialsProvider`	`StsGetSessionTokenCredentialsProvider.builder`
Asynchronous refresh	Default behavior	`StsGetSessionTokenCredentialsProvider.builder`
Configuration	Constructor parameters	Configure an `StsClient` and `GetSessionTokenRequest` request in a builder

`WebIdentityFederationSessionCredentialsProvider`

Change category	1.x	2.x
Package/class name	`com.amazonaws.auth.WebIdentityFederationSessionCredentialsProvider`	`software.amazon.awssdk.services.sts.auth.StsAssumeRoleWithWebIdentityCredentialsProvider`
Creation	`new WebIdentityFederationSessionCredentialsProvider`	`StsAssumeRoleWithWebIdentityCredentialsProvider.builder`

Change category	1.x	2.x
Asynchronous refresh	Default behavior	`StsAssumeRoleWithWebIdentityCredentialsProvider.builder`
Configuration	Constructor parameters	Configure an `StsClient` and `AssumeRoleWithWebIdentityRequest` request in a builder

Classes replaced

1.x class	2.x replacement classes
`com.amazonaws.auth.EC2ContainerCredentialsProviderWrapper`	`software.amazon.awssdk.auth.credentials.ContainerCredentialsProvider` and `software.amazon.awssdk.auth.credentials.InstanceProfileCredentialsProvider`
`com.amazonaws.services.s3.S3CredentialsProviderChain`	`software.amazon.awssdk.auth.credentials.DefaultCredentialsProvider` and `software.amazon.awssdk.auth.credentials.AnonymousCredentialsProvider`

Classes removed

1.x class
`com.amazonaws.auth.ClasspathPropertiesFileCredentialsProvider`
`com.amazonaws.auth.PropertiesFileCredentialsProvider`

Region changes

This section describes the changes implemented in the AWS SDK for Java 2.x for using the `Region` and `Regions` classes.

Region configuration

- Some AWS services don't have Region specific endpoints. When using those services, you must set the Region as `Region.AWS_GLOBAL` or `Region.AWS_CN_GLOBAL`.

  Example

  ```
  Region region = Region.AWS_GLOBAL;
  ```

- `com.amazonaws.regions.Regions` and `com.amazonaws.regions.Region` classes are now combined into one class, `software.amazon.awssdk.regions.Region`.

Method and class name mappings

The following tables map Region related classes between versions 1.x and 2.x of the AWS SDK for Java. You can create an instance of these classes using the `of()` method.

Example

```
RegionMetadata regionMetadata = RegionMetadata.of(Region.US_EAST_1);
```

1.x Regions class method changes

1.x	2.x
`Regions.fromName`	`Region.of`
`Regions.getName`	`Region.id`
`Regions.getDescription`	`Region.metadata().description()`
`Regions.getCurrentRegion`	Not Supported
`Regions.DEFAULT_REGION`	Not Supported

1.x	2.x
`Regions.name`	`Region.id`

1.x Region class method changes

1.x	2.x
`Region.getName`	`Region.id`
`Region.hasHttpsEndpoint`	Not Supported
`Region.hasHttpEndpoint`	Not Supported
`Region.getAvailableEndpoints`	Not Supported
`Region.createClient`	Not Supported

RegionMetadata class method changes

1.x	2.x
`RegionMetadata.getName`	`RegionMetadata.name`
`RegionMetadata.getDomain`	`RegionMetadata.domain`
`RegionMetadata.getPartition`	`RegionMetadata.partition`

ServiceMetadata class method changes

1.x	2.x
`Region.getServiceEndpoint`	`ServiceMetadata.endpointFor(Region)`
`Region.isServiceSupported`	`ServiceMetadata.regions().contains(Region)`

Operations, requests and responses changes

In v2.x of the SDK for Java, requests are passed to a client operation. For example `DynamoDbClient's PutItemRequest` is passed to `DynamoDbClient.putItem` operation. These operations return a response from the AWS service, such as a `PutItemResponse`.

Version 2.x of the SDK for Java has the following changes from 1.x.

- Operations with multiple response pages now have a `Paginator` method for automatically iterating over all items in the response.
- You cannot mutate requests and responses.
- You must create requests and responses with a static builder method instead of a constructor. For example, 1.x's `new PutItemRequest().withTableName(...)` is now `PutItemRequest.builder().tableName(...).build()`.
- Operations support a short-hand way to create requests: `dynamoDbClient.putItem(request -> request.tableName(...))`.

Streaming operation differences between 1.x and 2.x of the AWS SDK for Java

Streaming operations, such as Amazon S3 `getObject` and `putObject` methods, support non-blocking I/O in version 2.x of the SDK. As a result, the request and response model objects no longer take an `InputStream` as a parameter. Instead, for synchronous requests the request object accepts `RequestBody`, which is a stream of bytes. The asynchronous equivalent accepts an `AsyncRequestBody`.

Example of Amazon S3 `putObject` operation in 1.x

```
s3client.putObject(BUCKET, KEY, new File(file_path));
```

Example of Amazon S3 `putObject` operation in 2.x

```
s3client.putObject(PutObjectRequest.builder()
                                   .bucket(BUCKET)
                                   .key(KEY)
                                   .build(),
                   RequestBody.of(Paths.get("myfile.in")));
```

A streaming response object accepts a `ResponseTransformer` for synchronous clients and a `AsyncResponseTransformer` for asynchronous clients in V2.

Example of Amazon S3 `getObject` operation in 1.x

```
S3Object o = s3.getObject(bucket, key);
S3ObjectInputStream s3is = o.getObjectContent();
FileOutputStream fos = new FileOutputStream(new File(key));
```

Example of Amazon S3 `getObject` operation in 2.x

```
s3client.getObject(GetObjectRequest.builder().bucket(bucket).key(key).build(),
  ResponseTransformer.toFile(Paths.get("key")));
```

In the SDK for Java 2.x, streaming response operations have an `AsBytes` method to load the response into memory and simplify common type conversions in-memory.

Serialization differences between 1.x and 2.x of the AWS SDK for Java

List objects to request parameters difference

The SDK for Java v1.x and v2.x differ in how they serialize List objects to request parameters.

The SDK for Java 1.x does not serialize an empty list, whereas the SDK for Java 2.x serializes an empty list as an empty parameter.

For example, consider a service with a `SampleOperation` that takes a `SampleRequest`. The `SampleRequest` accepts two parameters—a String type `str1` and List type `listParam`—as shown in the following examples.

Example of `SampleOperation` in 1.x

```
SampleRequest v1Request = new SampleRequest()
    .withStr1("TestName");

sampleServiceV1Client.sampleOperation(v1Request);
```

Wire-level logging shows that the `listParam` parameter is not serialized.

```
Action=SampleOperation&Version=2011-01-01&str1=TestName
```

Example of `SampleOperation` in 2.x

```
sampleServiceV2Client.sampleOperation(b -> b
    .str1("TestName"));
```

Wire-level logging shows that the `listParam` parameter is serialized with no value.

```
Action=SampleOperation&Version=2011-01-01&str1=TestName&listParam=
```

POJOs in V1 compared to builders in V2

Because the V1 SDK for Java uses mutable POJO classes, serialization and deserialization libraries —such as Jackson—can use model objects directly.

The V2 SDK for Java, by contrast, uses immutable model objects. You must use an intermediate builder to perform de/serialization.

The following example shows the differences between de/serializing a `headBucket` API call with V1 and V2 using a Jackson `ObjectMapper`.

```
    public void sendRequest() throws IOException {
        final String bucketName = "amzn-s3-demo-bucket";
        final ObjectMapper mapper = new ObjectMapper();

        // V1 uses POJOs to serialize and deserialize.
        final AmazonS3 v1S3Client = AmazonS3ClientBuilder.defaultClient();
        HeadBucketResult resultV1 = v1S3Client.headBucket(
            new HeadBucketRequest(bucketName));

        String v1Serialized = mapper.writeValueAsString(resultV1);

        HeadBucketResult deserializedV1 = mapper.readValue(v1Serialized,
 HeadBucketResult.class);

        // V2 uses builders to serialize and deserialize.
        S3Client v2S3Client = S3Client.create();
        HeadBucketResponse v2Response = v2S3Client.headBucket(
            b -> b.bucket(bucketName));

        String v2Serialized = mapper.writeValueAsString(
            v2Response.toBuilder());
```

```
        HeadBucketResponse v2Deserialized = mapper.readValue(
            v2Serialized, HeadBucketResponse.serializableBuilderClass())
            .build();
    }
```

Deserialization differences between 1.x and 2.x of the AWS SDK for Java

Empty collections in V2 compared to `null`s in V1

The SDK for Java v1.x and v2.x differ in how they deserialize JSON responses with lists and maps that are empty.

When the SDK receives a response with a missing property that is modeled as a list or map, V1 deserializes the missing property to `null`, whereas V2 deserializes the property to an immutable empty collection object.

For example, consider the response returned for the `describeTable` method from a DynamoDB client. The following example method contains a V2 DynamoDB client and a V1 DynamoDB client that both execute the `describeTable` method on a table that has no global secondary indexes

Example of the deserialization of a property modeled as a list that is missing in the response

```
public void deserializationDiffs(){

    DescribeTableResponse v2Response = dynamoDbClientV2.describeTable(builder ->
 builder.tableName(TABLE_NAME));
    // V2 provides has* methods on model objects for list/map members. No null check
 needed.
    LOGGER.info( String.valueOf(v2Response.table().hasGlobalSecondaryIndexes()) );

 LOGGER.info( String.valueOf(v2Response.table().globalSecondaryIndexes().isEmpty()) );
    // V2 deserialize to an empty collection.
    LOGGER.info(v2Response.table().globalSecondaryIndexes().toString());

    // V1 deserialize to null.
    DescribeTableResult v1Result = dynamoDbClientV1.describeTable(new
 DescribeTableRequest(TABLE_NAME));
    if (v1Result.getTable().getGlobalSecondaryIndexes() != null){
        LOGGER.info(v1Result.getTable().getGlobalSecondaryIndexes().toString());
    } else {
        LOGGER.info("The list of global secondary indexes returned by the V1 call is
 <null>");
    }
```

```
}
```

The following shows the logged output:

```
INFO  org.example.DeserializationDifferences:45 - false
INFO  org.example.DeserializationDifferences:46 - true
INFO  org.example.DeserializationDifferences:48 - []
INFO  org.example.DeserializationDifferences:55 - The list of global secondary indexes
 returned by the V1 call is <null>
```

The Java SDK 2.x takes an idiomatic approach by deserializing empty lists and maps to immutable empty collections instead of returning `null`, promoting safer and more concise code. With V2, you can check if a service returned an attribute modeled as a list or map with the `has*` method, such as the `hasGlobalSecondaryIndexes` shown in the previous example.

This approach avoids the need for explicit `null` checks and aligns with modern Java best practices for handling absent or empty data structures.

Complete example

```
package org.example;

import com.amazonaws.regions.Regions;
import com.amazonaws.services.dynamodbv2.AmazonDynamoDB;
import com.amazonaws.services.dynamodbv2.AmazonDynamoDBClientBuilder;
import com.amazonaws.services.dynamodbv2.model.DescribeTableRequest;
import com.amazonaws.services.dynamodbv2.model.DescribeTableResult;
import org.slf4j.Logger;
import org.slf4j.LoggerFactory;
import software.amazon.awssdk.services.dynamodb.DynamoDbClient;
import software.amazon.awssdk.services.dynamodb.model.BillingMode;
import software.amazon.awssdk.services.dynamodb.model.DescribeTableResponse;
import software.amazon.awssdk.services.dynamodb.model.KeyType;
import software.amazon.awssdk.services.dynamodb.model.ScalarAttributeType;

import java.util.UUID;

public class DeserializationDifferences {
    private static final Logger LOGGER =
 LoggerFactory.getLogger(DeserializationDifferences.class);
    private static final String TABLE_NAME = "DeserializationTable-" +
 UUID.randomUUID();
```

```
    DynamoDbClient dynamoDbClientV2 = DynamoDbClient.create();
    AmazonDynamoDB dynamoDbClientV1 =
AmazonDynamoDBClientBuilder.standard().withRegion(Regions.US_EAST_1).build();

    public static void main(String[] args) {

        DeserializationDifferences difference = new DeserializationDifferences();
        difference.createTable();
        difference.deserializationDiffs();
        difference.deleteTable();
    }

    public void createTable(){
        dynamoDbClientV2.createTable(b -> b
                .billingMode(BillingMode.PAY_PER_REQUEST)
                .tableName(TABLE_NAME)
                .keySchema(b1 -> b1.attributeName("Id").keyType(KeyType.HASH))
                .attributeDefinitions(b2 ->
b2.attributeName("Id").attributeType(ScalarAttributeType.S)));
        dynamoDbClientV2.waiter().waitUntilTableExists(b -> b.tableName(TABLE_NAME));
    }

    public void deserializationDiffs(){

        DescribeTableResponse v2Response = dynamoDbClientV2.describeTable(builder ->
builder.tableName(TABLE_NAME));
        // V2 provides has* methods on model objects for list/map members. No null
check needed.
        LOGGER.info( String.valueOf(v2Response.table().hasGlobalSecondaryIndexes()) );

LOGGER.info( String.valueOf(v2Response.table().globalSecondaryIndexes().isEmpty()) );
        // V2 deserialize to an empty collection.
        LOGGER.info(v2Response.table().globalSecondaryIndexes().toString());

        // V1 deserialize to null.
        DescribeTableResult v1Result = dynamoDbClientV1.describeTable(new
DescribeTableRequest(TABLE_NAME));
        if (v1Result.getTable().getGlobalSecondaryIndexes() != null){
            LOGGER.info(v1Result.getTable().getGlobalSecondaryIndexes().toString());
        } else {
            LOGGER.info("The list of global secondary indexes returned by the V1 call
is <null>");
        }
    }
```

```
    public void deleteTable(){
        dynamoDbClientV2.deleteTable(b -> b.tableName(TABLE_NAME));
        dynamoDbClientV2.waiter().waitUntilTableNotExists(b ->
 b.tableName(TABLE_NAME));
    }
}
```

The JSON response for the `describeTable` method from the V1 and V2 client contains no `GlobalSecondaryIndexes` attribute:

```

```

Exception changes

Exception class names, their structures, and their relationships have changed. `software.amazon.awssdk.core.exception.SdkException` is the new base `Exception` class that all the other exceptions extend.

This table maps the exception class name changes.

1.x	2.x
`com.amazonaws.SdkBaseException com.amazonaws.AmazonClientException`	`software.amazon.awssdk.core.exception.SdkException`
`com.amazonaws.SdkClientException`	`software.amazon.awssdk.core.exception.SdkClientException`
`com.amazonaws.AmazonServiceException`	`software.amazon.awssdk.awscore.exception.AwsServiceException`

The following table maps the methods on exception classes between version 1.x and 2.x.

1.x	2.x
`AmazonServiceException.getRequestId`	`SdkServiceException.requestId`

1.x	2.x
`AmazonServiceException.getServiceName`	`AwsServiceException.awsErrorDetails().serviceName`
`AmazonServiceException.getErrorCode`	`AwsServiceException.awsErrorDetails().errorCode`
`AmazonServiceException.getErrorMessage`	`AwsServiceException.awsErrorDetails().errorMessage`
`AmazonServiceException.getStatusCode`	`AwsServiceException.awsErrorDetails().sdkHttpResponse().statusCode`
`AmazonServiceException.getHttpHeaders`	`AwsServiceException.awsErrorDetails().sdkHttpResponse().headers`
`AmazonServiceException.rawResponse`	`AwsServiceException.awsErrorDetails().rawResponse`

Service-specific changes

Amazon S3 changes

SDK for Java 2.x disables anonymous access by default. As a result, you must enable anonymous access by using the `AnonymousCredentialsProvider`.

Operation name changes

Many of the operation names for the Amazon S3 client have changed in the AWS SDK for Java 2.x. In version 1.x, the Amazon S3 client is not generated directly from the service API. This results in inconsistency between the SDK operations and the service API. In version 2.x, we now generate the Amazon S3 client to be more consistent with the service API.

The following table shows the operation names in the two versions.

Amazon S3 Operation names

1.x	2.x
abortMultipartUpload	abortMultipartUpload
changeObjectStorageClass	copyObject
completeMultipartUpload	completeMultipartUpload
copyObject	copyObject

Amazon SNS changes

An SNS client can no longer access SNS topics in Regions other than the Region that it is configured to access.

Amazon SQS changes

An SQS client can no longer access SQS queues in Regions other than the Region that it is configured to access.

Amazon RDS changes

The SDK for Java 2.x uses `RdsUtilities#generateAuthenticationToken` in place of the class `RdsIamAuthTokenGenerator` in 1.x.

Changes in working with Amazon S3 from version 1 to version 2 of the AWS SDK for Java

The AWS SDK for Java 2.x introduces significant changes to the S3 client, including a new package structure, updated class names, and revised method signatures. While many methods can be automatically migrated from V1 to V2 using the migration tool, some require manual migration, such as `listNextBatchOfObjects` and `selectObjectContent`. Additionally, V2 replaces certain V1 classes like `AccessControlList` and `CannedAccessControlList` with new implementations.

Topics

- S3 client differences between version 1 and version 2 of the AWS SDK for Java
- Migrate the Transfer Manager from version 1 to version 2 of the AWS SDK for Java
- Changes in parsing Amazon S3 URIs from version 1 to version 2
- Changes in the S3 Event Notifications API from version 1 to version 2

S3 client differences between version 1 and version 2 of the AWS SDK for Java

In this topic, the differences between the S3 clients in version 1 and version 2 of SDK for Java are organized by how the migration tool can automate the migration. The tool supports migration of most methods from V1 to V2, but some methods require manual migration. In additional to S3 client methods, some S3 V1 classes do not have a direct V2 equivalent requiring you to manually migrate them.

Contents

- Example V1 methods supported by the migration tool
  - putObject
  - getObject
- V1 methods that require manual migration
  - V1's getObject using V1's S3ObjectId to V2's GetObjectRequest.builder()
  - V1's listNextBatchOfObjects to V2's listObjectsV2Paginator
  - V1's listNextBatchOfVersions to V2's listObjectVersionsPaginator
  - selectObjectContent
  - V1's setBucketAcl to V2's acl method on PutBucketAclRequest.builder()
  - V1's setObjectAcl to V2's acl method on PutObjectAclRequest.builder()
  - V1's initiateMultipartUpload to V2's createMultipartUpload
    - Example migration
    - Implementation differences
  - V1's setRegion to V2's region method on client builder
  - V1's setS3ClientOptions(S3ClientOptions clientOptions)
  - V1's setBucketLoggingConfiguration to V2's putBucketLogging
  - V1's setBucketLifecycleConfiguration to V2's putBucketLifecycleConfiguration
  - V1's setBucketTaggingConfiguration to V2's putBucketTagging
- V1 classes that require manual migration
  - V1's AccessControlList to V2's AccessControlPolicy
  - V1's CannedAccessControlList enum to V2's BucketCannedACL and ObjectCannedACL enums
  - V1's BucketNotificationConfiguration to V2's NotificationConfiguration
  - V1's MultiFactorAuthentication to V2's mfa method on a request builder

Example V1 methods supported by the migration tool

The migration tool automatically migrates most methods from V1 to V2. The `putObject` and `getObject` methods are two examples.

`putObject`

```
// SDK V1
```

```
s3Client.putObject("my-bucket", "my-key", "Hello World!");

// SDK V2
s3Client.putObject(req -> req
    .bucket("my-bucket")
    .key("my-key"),
    RequestBody.fromString("Hello World!"));
```

`getObject`

```
// SDK V1
S3Object object = s3Client.getObject("my-bucket", "my-key");
InputStream content = object.getObjectContent();

// SDK V2
ResponseInputStream<GetObjectResponse> response = s3Client.getObject(req -> req
    .bucket("my-bucket")
    .key("my-key"));
```

V1 methods that require manual migration

You need to manually migrate the following V1 S3 client methods. When you use the migration tool, you see a comment in the V2 output Java file that directs you to this topic.

V1's `getObject` using V1's `S3ObjectId` to V2's `GetObjectRequest.builder()`

```
// SDK V1
AmazonS3 s3ClientV1 = AmazonS3ClientBuilder.standard()
        .withRegion(Regions.US_WEST_2)
        .build();

S3ObjectId s3ObjectId = new S3ObjectId(
    "my-bucket",
    "object-key",
    "abc123version"
);

GetObjectRequest getRequest= new GetObjectRequest(s3ObjectId);
S3Object s3ObjectVersioned = s3Client.getObject(getRequest);
```

```
// SDK V2
// V2 does not include a 'S3ObjectId' class. V2 uses the request builder pattern
// to supply the bucket, key, and version parameters.
S3Client s3Client = S3Client.builder()
    .region(Region.US_WEST_2)
    .build();

GetObjectRequest getRequest = GetObjectRequest.builder()
    .bucket("my-bucket")
    .key("object-key")
    .versionId("abc123version")
    .build();

ResponseInputStream<GetObjectResponse> response = s3Client.getObject(getRequest);
```

V1's `listNextBatchOfObjects` to V2's `listObjectsV2Paginator`

```
// SDK V1
AmazonS3 s3ClientV1 = AmazonS3ClientBuilder.standard()
    .withRegion(Regions.US_WEST_2)
    .build();

ObjectListing objectListing = s3ClientV1.listObjects("bucket-name");
while (objectListing.isTruncated()) {
    objectListing = s3ClientV1.listNextBatchOfObjects(objectListing);
    for (S3ObjectSummary summary : objectListing.getObjectSummaries()) {
        System.out.println(summary.getKey());
    }
}

// SDK V2
S3Client s3ClientV2 = S3Client.builder()
    .region(Region.US_WEST_2)
    .build();

ListObjectsV2Request request = ListObjectsV2Request.builder()
    .bucket("bucket-name")
    .build();

// V2 returns a paginator.
ListObjectsV2Iterable responses = s3Client.listObjectsV2Paginator(request);
```

```
for (ListObjectsV2Response page : responses) {
    page.contents().forEach(content -> {
        System.out.println(content.key());
    });
}
```

V1's `listNextBatchOfVersions` to V2's `listObjectVersionsPaginator`

```
// SDK V1
AmazonS3 s3ClientV1 = AmazonS3ClientBuilder.standard()
    .withRegion(Regions.US_WEST_2)
    .build();

VersionListing versionListing = s3ClientV1.listVersions("bucket-name", "prefix");
while (versionListing.isTruncated()) {
    versionListing = s3ClientV1.listNextBatchOfVersions(versionListing);
    for (S3VersionSummary version : versionListing.getVersionSummaries()) {
        System.out.println(version.getKey() + " " + version.getVersionId());
    }
}

// SDK V2
S3Client s3ClientV2 = S3Client.builder()
    .region(Region.US_WEST_2)
    .build();

ListObjectVersionsRequest request = ListObjectVersionsRequest.builder()
    .bucket("bucket-name")
    .prefix("prefix")
    .build();

// V2 returns a paginator.
ListObjectVersionsIterable responses = s3ClientV2.listObjectVersionsPaginator(request);

for (ListObjectVersionsResponse page : responses) {
    page.versions().forEach(version -> {
        System.out.println(version.key() + " " + version.versionId());
    });
}
```

`selectObjectContent`

```
// SDK V1
AmazonS3 s3ClientV1 = AmazonS3ClientBuilder.standard()
    .withRegion(Regions.US_WEST_2)
    .build();

SelectObjectContentRequest request = new SelectObjectContentRequest()
    .withBucket("bucket-name")
    .withKey("object-key")
    .withExpression("select * from S3Object")
    .withExpressionType(ExpressionType.SQL)

SelectObjectContentResult result = s3ClientV1.selectObjectContent(request);
InputStream resultInputStream = result.getPayload().getRecordsInputStream();

// SDK V2
// In V2, 'selectObjectContent()' is available only on the S3AsyncClient.
// V2 handles responses using an event-based 'SelectObjectContentEventStream'.
S3AsyncClient s3ClientV2 = S3AsyncClient.builder()
    .region(Region.US_WEST_2)
    .build();

SelectObjectContentRequest request = SelectObjectContentRequest.builder()
    .bucket("bucket-name")
    .key("object-key")
    .expression("select * from S3Object")
    .expressionType(ExpressionType.SQL)
    .build();

SelectObjectContentResponseHandler handler = new SelectObjectContentResponseHandler() {
    // Implement the required abstract methods such as 'onEventStream()'.
};

CompletableFuture<Void> future = s3ClientV2.selectObjectContent(request, handler);
// The 'SelectObjectContentResponseHandler' implementation processes the results.
```

V1's `setBucketAcl` to V2's `acl` method on `PutBucketAclRequest.builder()`

```
// SDK V1
AmazonS3 s3ClientV1 = AmazonS3ClientBuilder.standard()
```

```
    .withRegion(Regions.US_WEST_2)
    .build();

AccessControlList acl = new AccessControlList();
acl.grantPermission(GroupGrantee.AllUsers, Permission.Read);
s3ClientV1.setBucketAcl("bucket-name", acl);

// SDK V2
S3Client s3ClientV2 = S3Client.builder()
    .region(Region.US_WEST_2)
    .build();

PutBucketAclRequest request = PutBucketAclRequest.builder()
    .bucket("bucket-name")
    .acl(BucketCannedACL.PRIVATE)
    .build();

s3ClientV2.putBucketAcl(request);
```

V1's `setObjectAcl` to V2's `acl` method on `PutObjectAclRequest.builder()`

```
// SDK V1
AmazonS3 s3ClientV1 = AmazonS3ClientBuilder.standard()
    .withRegion(Regions.US_WEST_2)
    .build();

AccessControlList acl = new AccessControlList();
acl.grantPermission(GroupGrantee.AllUsers, Permission.Read);
s3ClientV1.setObjectAcl("bucket-name", "object-key", acl);

// SDK V2
S3Client s3ClientV2 = S3Client.builder()
    .region(Region.US_WEST_2)
    .build();

PutObjectAclRequest request = PutObjectAclRequest.builder()
    .bucket("bucket-name")
    .key("object-key")
    .acl(ObjectCannedACL.PRIVATE)
    .build();
```

```
s3ClientV2.putObjectAcl(request);
```

V1's `initiateMultipartUpload` to V2's `createMultipartUpload`

Example migration

```
// SDK V1
AmazonS3 s3ClientV1 = AmazonS3ClientBuilder.standard()
    .withRegion(Regions.US_WEST_2)
    .build();

ObjectMetadata metadata = new ObjectMetadata();
metadata.setContentType("application/zip");
metadata.addUserMetadata("mykey", "myvalue");

InitiateMultipartUploadRequest initRequest = new InitiateMultipartUploadRequest(
    "bucket-name",
    "object-key",
    metadata
);

InitiateMultipartUploadResult initResponse =
 s3ClientV1.initiateMultipartUpload(initRequest);
String uploadId = initResponse.getUploadId();

// SDK V2
// V1 uses ObjectMetadata methods, whereas V2 uses a simple Map.
S3Client s3ClientV2 = S3Client.builder()
    .region(Region.US_WEST_2)
    .build();

CreateMultipartUploadRequest createMultipartRequest =
 CreateMultipartUploadRequest.builder()
    .bucket("my-bucket")
    .key("object-key")
    .contentType("application/zip")
    .metadata(Collections.singletonMap("mykey", "myvalue"))
    .build();

CreateMultipartUploadResponse response =
 s3ClientV2.createMultipartUpload(createMultipartRequest);
String uploadId = response.uploadId();
```

Implementation differences

The default `Content-Type` header value for the following methods differ as shown in the following table.

SDK version	Method	Default `Content-Type` value
version 1	`initiateMultipartUpload`	`application/octet-stream`
version 2	`createMultipartUpload`	`binary/octet-stream`

V1's `setRegion` to V2's `region` method on client builder

```
// SDK V1
AmazonS3 s3ClientV1 = AmazonS3ClientBuilder.standard().build();
s3ClientV1.setRegion(Region.getRegion(Regions.US_WEST_2));

// SDK V2
S3Client s3ClientV2 = S3Client.builder()
    .region(Region.US_WEST_2)
    .build();
```

V1's `setS3ClientOptions(S3ClientOptions clientOptions)`

Instead of using a single `S3ClientOptions` object with the `setS3ClientOptions` method, V2 provides methods on the client builder to set options.

V1's `setBucketLoggingConfiguration` to V2's `putBucketLogging`

```
// SDK V1
AmazonS3 s3ClientV1 = AmazonS3ClientBuilder.standard()
    .withRegion(Regions.US_WEST_2)
    .build();

BucketLoggingConfiguration loggingConfig = new BucketLoggingConfiguration();
loggingConfig.setDestinationBucketName("log-bucket");
```

```
SetBucketLoggingConfigurationRequest request = new
 SetBucketLoggingConfigurationRequest(
    "source-bucket",
    loggingConfig
);

s3ClientV1.setBucketLoggingConfiguration(request);

// SDK V2
// In V2, V1's 'BucketLoggingConfiguration' is replaced by 'BucketLoggingStatus'
// and 'LoggingEnabled'.
S3Client s3ClientV2 = S3Client.builder()
    .region(Region.US_WEST_2)
    .build();

LoggingEnabled loggingEnabled = LoggingEnabled.builder()
    .targetBucket("log-bucket")
    .build();

BucketLoggingStatus loggingStatus = BucketLoggingStatus.builder()
    .loggingEnabled(loggingEnabled)
    .build();

PutBucketLoggingRequest request = PutBucketLoggingRequest.builder()
    .bucket("source-bucket")
    .bucketLoggingStatus(loggingStatus)
    .build();

s3ClientV2.putBucketLogging(request);
```

V1's `setBucketLifecycleConfiguration` to V2's `putBucketLifecycleConfiguration`

```
// SDK V1
BucketLifecycleConfiguration.Rule rule = new BucketLifecycleConfiguration.Rule()
    .withId("Archive and Delete Rule")
    .withPrefix("documents/")
    .withStatus(BucketLifecycleConfiguration.ENABLED)
    .withTransitions(Arrays.asList(
        new Transition()
            .withDays(30)
            .withStorageClass(StorageClass.StandardInfrequentAccess.toString()),
```

```
        new Transition()
            .withDays(90)
            .withStorageClass(StorageClass.Glacier.toString())
    ))
    .withExpirationInDays(365);

BucketLifecycleConfiguration configuration = new BucketLifecycleConfiguration()
    .withRules(Arrays.asList(rule));

s3ClientV1.setBucketLifecycleConfiguration("my-bucket", configuration);

// SDK V2
LifecycleRule rule = LifecycleRule.builder()
    .id("Archive and Delete Rule")
    .filter(LifecycleRuleFilter.builder()
        .prefix("documents/")
        .build())
    .status(ExpirationStatus.ENABLED)
    .transitions(Arrays.asList(
        Transition.builder()
            .days(30)
            .storageClass(TransitionStorageClass.STANDARD_IA)
            .build(),
        Transition.builder()
            .days(90)
            .storageClass(TransitionStorageClass.GLACIER)
            .build()
    ))
    .expiration(LifecycleExpiration.builder()
        .days(365)
        .build())
    .build();

PutBucketLifecycleConfigurationRequest request =
 PutBucketLifecycleConfigurationRequest.builder()
    .bucket("my-bucket")
    .lifecycleConfiguration(BucketLifecycleConfiguration.builder()
        .rules(rule)
        .build())
    .build();

s3ClientV2.putBucketLifecycleConfiguration(request);
```

V1's `setBucketTaggingConfiguration` to V2's `putBucketTagging`

```
// SDK V1
List<TagSet> tagsets = new ArrayList<>();
TagSet tagSet = new TagSet();
tagSet.setTag("key1", "value1");
tagSet.setTag("key2", "value2");
tagsets.add(tagSet);

BucketTaggingConfiguration bucketTaggingConfiguration = new
 BucketTaggingConfiguration();
bucketTaggingConfiguration.setTagSets(tagsets);

SetBucketTaggingConfigurationRequest request = new
 SetBucketTaggingConfigurationRequest(
    "my-bucket",
    bucketTaggingConfiguration
);

s3ClientV1.setBucketTaggingConfiguration(request);

// SDK V2
Tagging tagging = Tagging.builder()
    .tagSet(Arrays.asList(
        Tag.builder()
            .key("key1")
            .value("value1")
            .build(),
        Tag.builder()
            .key("key2")
            .value("value2")
            .build()
    ))
    .build();

PutBucketTaggingRequest request = PutBucketTaggingRequest.builder()
    .bucket("my-bucket")
    .tagging(tagging)
    .build();

s3ClientV2.putBucketTagging(request);
```

V1 classes that require manual migration

V1's `AccessControlList` to V2's `AccessControlPolicy`

```
// SDK V1
AccessControlList aclV1 = new AccessControlList();
aclV1.setOwner(new Owner("owner-id", "owner-name"));
aclV1.grantPermission(GroupGrantee.AllUsers, Permission.Read);

// SDK V2
// To migrate from V1 to V2, replace direct 'AccessControlList' modifications with an
// 'AccessControlPolicy.builder()' that contains both owner information and grants.
// Note that V2's approach requires building the complete permission set upfront rather
 than modifying permissions incrementally.
AccessControlPolicy acpV2 = AccessControlPolicy.builder()
    .owner(Owner.builder()
        .id("owner-id")
        .displayName("owner-name")
        .build())
    .grants(Arrays.asList(
         Grant.builder()
            .grantee(Grantee.builder()
                 .type(Type.GROUP)
                 .uri("http://acs.amazonaws.com/groups/global/AllUsers")
                 .build())
             .permission(Permission.READ)
             .build()
     ))
     .build();
```

V1's `CannedAccessControlList` enum to V2's `BucketCannedACL` and `ObjectCannedACL` enums

```
// SDK V1
// In V1, 'CannedAccessControlList' is an enumeration of predefined ACLs.
AmazonS3 s3ClientV1 = AmazonS3ClientBuilder.standard().build();

// Creating a bucket.
s3ClientV1.setBucketAcl("bucket-name", CannedAccessControlList.PublicRead);

// Creating an object.
PutObjectRequest putObjectRequest = new PutObjectRequest("bucket-name", "object-key",
 file)
```

```
    .withCannedAcl(CannedAccessControlList.PublicRead);
s3ClientV1.putObject(putObjectRequest);

// SDK V2
// V2 replaces V1's 'CannedAccessControlList' with 'BucketCannedACL' for buckets and
 'ObjectCannedACL' for objects.
S3Client s3ClientV2 = S3Client.builder().build();

// Creating a bucket.
PutBucketAclRequest bucketRequest = PutBucketAclRequest.builder()
    .bucket("bucket-name")
    .acl(BucketCannedACL.PRIVATE)
    .build();
s3ClientV2.putBucketAcl(bucketRequest);

// Creating an object.
PutObjectRequest objectRequest = PutObjectRequest.builder()
    .bucket("bucket-name")
    .key("object-key")
    .acl(ObjectCannedACL.PUBLIC_READ)
    .build();
s3ClientV2.putObject(objectRequest, RequestBody.fromFile(file));
```

V1's `BucketNotificationConfiguration` to V2's `NotificationConfiguration`

```
//SDK V1
BucketNotificationConfiguration notificationConfig = new
 BucketNotificationConfiguration();

// Adding configurations by name
notificationConfig.addConfiguration("lambdaConfig",
    new LambdaConfiguration("arn:aws:lambda:function", "s3:ObjectCreated:"));

notificationConfig.addConfiguration("topicConfig",
    new TopicConfiguration("arn:aws:sns:topic", "s3:ObjectRemoved:"));

notificationConfig.addConfiguration("queueConfig",
    new QueueConfiguration("arn:aws:sqs:queue", "s3:ObjectRestore:*"));

s3Client.setBucketNotificationConfiguration("bucket", notificationConfig);
```

```
// SDK V2
// In V2, V1's BucketNotificationConfiguration is renamed to
 NotificationConfiguration.
// V2 contains no common abstract class for LambdaFunction/Topic/Queue configurations.
NotificationConfiguration notificationConfig = NotificationConfiguration.builder()
    .lambdaFunctionConfigurations(
        LambdaFunctionConfiguration.builder()
            .lambdaFunctionArn("arn:aws:lambda:function")
            .events(Event.valueOf("s3:ObjectCreated:"))
            .build())
    .topicConfigurations(
        TopicConfiguration.builder()
            .topicArn("arn:aws:sns:topic")
            .events(Event.valueOf("s3:ObjectRemoved:"))
            .build())
    .queueConfigurations(
        QueueConfiguration.builder()
            .queueArn("arn:aws:sqs:queue")
            .events(Event.valueOf("s3:ObjectRestore:*"))
            .build())
    .build();

s3Client.putBucketNotificationConfiguration(req -> req
    .bucket("bucket")
    .notificationConfiguration(notificationConfig));
```

V1's `MultiFactorAuthentication` to V2's `mfa` method on a request builder

```
// SDK V1
AmazonS3 s3ClientV1 = AmazonS3ClientBuilder.standard()
    .withRegion(Regions.US_WEST_2)
    .build();

BucketVersioningConfiguration versioningConfig = new BucketVersioningConfiguration()
    .withStatus(BucketVersioningConfiguration.ENABLED);

// Create an MFA configuration object.
MultiFactorAuthentication mfa = new MultiFactorAuthentication(
    "arn:aws:iam::1234567890:mfa/user",
    "123456"
);

// Create the request object.
```

```
SetBucketVersioningConfigurationRequest request = new
 SetBucketVersioningConfigurationRequest(
    "bucket-name",
    versioningConfig,
    mfa
);

// Send the request.
s3ClientV1.setBucketVersioningConfiguration(request);

// SDK V2
// V2 replaces V1's MultiFactorAuthentication POJO with parameters you set on the
 request builder.
S3Client s3ClientV2 = S3Client.builder()
    .region(Region.US_WEST_2)
    .build();

PutBucketVersioningRequest request = PutBucketVersioningRequest.builder()
    .bucket("bucket-name")
    .versioningConfiguration(VersioningConfiguration.builder()
        .status(BucketVersioningStatus.ENABLED)
        .build())
    .mfa("arn:aws:iam::1234567890:mfa/user 123456")  // Single method takes both MFA
 erial number and token.
    .build();

s3ClientV2.putBucketVersioning(request);
```

Migrate the Transfer Manager from version 1 to version 2 of the AWS SDK for Java

This migration guide covers the key differences between Transfer Manager v1 and S3 Transfer Manager v2, including constructor changes, method mappings, and code examples for common operations. After reviewing these differences, you can successfully migrate your existing Transfer Manager code to take advantage of improved performance and asynchronous operations in v2.

> **⚠ About the AWS SDK migration tool**
>
> The AWS SDK for Java provides an automated migration tool that can migrate much of the v1 Transfer Manager API to v2. However, the migration tool doesn't support several v1 Transfer Manager features. For these cases, you need to manually migrate Transfer Manager code using the guidance in this topic.

Throughout this guide, the **Migration Status** shows whether the migration tool can automatically migrate a constructor, method, or feature:

- **Supported**: The migration tool can automatically transform this code
- **Not Supported**: You need to manually migrate code

Even for items marked as "Supported," review the migration results and test thoroughly. Transfer Manager migration involves significant architectural changes from synchronous to asynchronous operations.

Overview

S3 Transfer Manager v2 introduces significant changes to the Transfer Manager API. S3 Transfer Manager v2 is built on asynchronous operations and provides better performance, especially when you use the AWS CRT-based Amazon S3 client.

Key differences

- **Package**: `com.amazonaws.services.s3.transfer` → `software.amazon.awssdk.transfer.s3`
- **Class name**: `TransferManager` → `S3TransferManager`
- **Client dependency**: Synchronous Amazon S3 client → Asynchronous Amazon S3 client (`S3AsyncClient`)
- **Architecture**: Synchronous operations → Asynchronous operations with `CompletableFuture`
- **Performance**: Enhanced with AWS CRT-based client support

High-level changes

Aspect	V1	V2
Maven dependency	`aws-java-sdk-s3`	`s3-transfer-manager`
Package	`com.amazonaws.services.s3.transfer`	`software.amazon.awssdk.transfer.s3`
Main class	`TransferManager`	`S3TransferManager`

Aspect	V1	V2
Amazon S3 client	AmazonS3 (sync)	S3AsyncClient (async)
Return types	Blocking operations	CompletableFuture<T>

Maven dependencies

V1

```
<dependencyManagement>
    <dependencies>
        <dependency>
            <groupId>com.amazonaws</
groupId>
            <artifactId>aws-java-sdk-
bom</artifactId>
            <version>> 1.12.787[1]</
version>

    </dependency>
```

V1	V2
	</dependencies>

[1] Latest version. [2] Latest version. [3] Latest version.

Client constructor migration

Supported constructors (automatic migration)

V1 constructor	V2 equivalent	Migration status
new TransferManager()	S3TransferManager.create()	Supported
TransferManagerBuilder.defaultTransferManager()	S3TransferManager.create()	Supported
TransferManagerBuilder.standard().build()	S3TransferManager.builder().build()	Supported
new TransferManager(AWSCredentials)	S3TransferManager.builder() .s3Client(S3AsyncClient.builder() .credentialsProvider(...).build()) .build()	Supported
new TransferManager(AWSCredentialsProvider)	S3TransferManager.builder() .s3Client(S3AsyncClient.builder() .credentialsProvider(...).build()) .build()	Supported

Unsupported constructors (manual migration required)

V1 constructor	V2 equivalent	Migration notes
`new TransferManager(AmazonS3)`	Manual migration required	Create an `S3AsyncClient` separately
`new TransferManager(AmazonS3, ExecutorService)`	Manual migration required	Create an `S3AsyncClient` and configure executor
`new TransferManager(AmazonS3, ExecutorService, boolean)`	Manual migration required	`shutDownThreadPools` parameter not supported

Manual migration examples

V1 code:

```
AmazonS3 s3Client = AmazonS3ClientBuilder.defaultClient();
TransferManager transferManager = new TransferManager(s3Client);
```

V2 code:

```
// Create an `S3AsyncClient` with similar configuration
S3AsyncClient s3AsyncClient = S3AsyncClient.builder()
    .credentialsProvider(DefaultCredentialsProvider.create())
    .build();

// Provide the configured `S3AsyncClient` to the S3 transfer manager builder.
S3TransferManager transferManager = S3TransferManager.builder()
    .s3Client(s3AsyncClient)
    .build();
```

Client method migration

Currently, the migration tool supports basic `copy`, `download`, `upload`, `uploadDirectory`, `downloadDirectory`, `resumeDownload`, and `resumeUpload` methods.

Core transfer methods

V1 method	V2 method	Return type change	Migration status
`upload(String, String, File)`	`uploadFile(UploadFileRequest)`	`Upload` → `FileUpload`	Supported
`upload(PutObjectRequest)`	`upload(UploadRequest)`	`Upload` → `Upload`	Supported
`download(String, String, File)`	`downloadFile(DownloadFileRequest)`	`Download` → `FileDownload`	Supported
`download(GetObjectRequest, File)`	`downloadFile(DownloadFileRequest)`	`Download` → `FileDownload`	Supported
`copy(String, String, String, String)`	`copy(CopyRequest)`	`Copy` → `Copy`	Supported
`copy(CopyObjectRequest)`	`copy(CopyRequest)`	`Copy` → `Copy`	Supported
`uploadDirectory(String, String, File, boolean)`	`uploadDirectory( UploadDirectoryRequest)`	`MultipleFileUpload` → `DirectoryUpload`	Supported
`downloadDirectory(String, String, File)`	`downloadDirectory( DownloadDirectoryRequest)`	`MultipleFileDownload` → `DirectoryDownload`	Supported

Resumable transfer methods

V1 method	V2 method	Migration status
`resumeUpload(PersistableUpload)`	`resumeUploadFile(ResumableFileUpload)`	Supported
`resumeDownload(PersistableDownload)`	`resumeDownloadFile(ResumableFileDownload)`	Supported

Lifecycle methods

V1 method	V2 method	Migration status
`shutdownNow()`	`close()`	Supported
`shutdownNow(boolean)`	Manually adjust code using the `close()` method	Not Supported

Unsupported V1 client methods

V1 method	V2 alternative	Notes
`abortMultipartUploads(String, Date)`	Use the low-level Amazon S3 client	Not Supported
`getAmazonS3Client()`	Save a reference separately	Not Supported; no getter in v2
`getConfiguration()`	Save a reference separately	Not Supported; no getter in v2
`uploadFileList(...)`	Make multiple `uploadFile()` calls	Not Supported

V1 method	V2 alternative	Notes
copy methods with a `TransferStateChangeListener` parameter	Use `TransferListener`	See manual migration example
download methods with an `S3ProgressListener` parameter	Use `TransferListener`	See manual migration example
`downloadDirectory` methods with 4 or more parameters		See manual migration example
upload method with an `ObjectMetadataProvider` parameter	Set metadata in request	See manual migration example
`uploadDirectory` methods with `*Provider` parameter	Set tags in request	See manual migration example

copy methods with a `TransferStateChangeListener` parameter

- `copy(CopyObjectRequest copyObjectRequest, AmazonS3 srcS3, TransferStateChangeListener stateChangeListener)`
- `copy(CopyObjectRequest copyObjectRequest, TransferStateChangeListener stateChangeListener)`

```
// V1
 ---------------------------------------------------------------------------------------------
// Initialize source S3 client
AmazonS3 s3client = AmazonS3ClientBuilder.standard()
                .withRegion("us-west-2")
                .build();

// Initialize Transfer Manager
TransferManager tm = TransferManagerBuilder.standard()
                .withS3Client(srcS3)
                .build();
```

```
CopyObjectRequest copyObjectRequest = new CopyObjectRequest(
                "amzn-s3-demo-source-bucket",
                "source-key",
                "amzn-s3-demo-destination-bucket",
                "destination-key"
        );

TransferStateChangeListener stateChangeListener = new TransferStateChangeListener() {
            @Override
            public void transferStateChanged(Transfer transfer, TransferState state) {
              //Implementation of the TransferStateChangeListener
            }
        };

Copy copy = tm.copy(copyObjectRequest, srcS3, stateChangeListener);

// V2
 ---------------------------------------------------------------------------------------------------
S3AsyncClient s3AsyncClient = S3AsyncClient.builder()
                .region(Region.US_WEST_2)
                .build();

S3TransferManager transferManager = S3TransferManager.builder()
                .s3Client(s3AsyncClient)
                .build();

// Create transfer listener (equivalent to TransferStateChangeListener in v1)

TransferListener transferListener = new TransferListener() {
            @Override
            public void transferInitiated(Context.TransferInitiated context) {
               //Implementation
               System.out.println("Transfer initiated");
            }

            @Override
            public void bytesTransferred(Context.BytesTransferred context) {
                //Implementation
                System.out.println("Bytes transferred");
            }

            @Override
```

```
            public void transferComplete(Context.TransferComplete context) {
                //Implementation
                System.out.println("Transfer completed!");
            }

            @Override
            public void transferFailed(Context.TransferFailed context) {
                //Implementation
                System.out.println("Transfer failed");
            }
        };

CopyRequest copyRequest = CopyRequest.builder()
                              .copyObjectRequest(req -> req
                                  .sourceBucket("amzn-s3-demo-source-bucket")
                                  .sourceKey("source-key")
                                  .destinationBucket("amzn-s3-demo-destination-bucket")
                                  .destinationKey("destination-key")
                               )
                                .addTransferListener(transferListener) // Configure the
 transferListener into the request
                                .build();

Copy copy = transferManager.copy(copyRequest);
```

`download` methods with an `S3ProgressListener` parameter

- `download(GetObjectRequest getObjectRequest, File file, S3ProgressListener progressListener)`
- `download(GetObjectRequest getObjectRequest, File file, S3ProgressListener progressListener, long timeoutMillis)`
- `download(GetObjectRequest getObjectRequest, File file, S3ProgressListener progressListener, long timeoutMillis, boolean resumeOnRetry)`

```
// V1
 ----------------------------------------------------------------------------------------
S3ProgressListener progressListener = new S3ProgressListener() {
        @Override
        public void progressChanged(com.amazonaws.event.ProgressEvent progressEvent) {
            long bytes = progressEvent.getBytesTransferred();
            ProgressEventType eventType = progressEvent.getEventType();
```

```
            // Use bytes and eventType as needed
        }

        @Override
        public void onPersistableTransfer(PersistableTransfer persistableTransfer) {

        }
    };

Download download1 = tm.download(getObjectRequest, file, progressListener);
Download download2 = tm.download(getObjectRequest, file, progressListener,
 timeoutMillis)
Download download3 = tm.download(getObjectRequest, file, progressListener,
 timeoutMillis, true)

// V2
 ---------------------------------------------------------------------------------------------
TransferListener transferListener = new TransferListener() {
    @Override
    public void transferInitiated(Context.InitializedContext context) {
        // Equivalent to ProgressEventType.TRANSFER_STARTED_EVENT
        System.out.println("Transfer initiated");
    }

    @Override
    public void bytesTransferred(Context.BytesTransferred context) {
        // Equivalent to ProgressEventType.REQUEST_BYTE_TRANSFER_EVENT
        long bytes = context.bytesTransferred();
        System.out.println("Bytes transferred: " + bytes);
    }

    @Override
    public void transferComplete(Context.TransferComplete context) {
        // Equivalent to ProgressEventType.TRANSFER_COMPLETED_EVENT
        System.out.println("Transfer completed");
    }

    @Override
    public void transferFailed(Context.TransferFailed context) {
        // Equivalent to ProgressEventType.TRANSFER_FAILED_EVENT
        System.out.println("Transfer failed: " + context.exception().getMessage());
    }
};
DownloadFileRequest downloadFileRequest =
```

```
                            DownloadFileRequest.builder()
                                .getObjectRequest(getObjectRequest)
                                .destination(file.toPath())
                                .addTransferListener(transferListener)
                                .build();

// For download1
FileDownload download = transferManager.downloadFile(downloadFileRequest);

// For download2
CompletedFileDownload completedFileDownload = download.completionFuture()
                                                      .get(timeoutMillis,
 TimeUnit.MILLISECONDS);

// For download3, the v2 SDK does not have a direct equiavalent to the `resumeOnRetry`
 method of v1.
// If a download is interrupted, you need to start a new download request.
```

`downloadDirectory` methods with 4 or more parameters

- `downloadDirectory(String bucketName, String keyPrefix, File destinationDirectory, boolean resumeOnRetry)`
- `downloadDirectory(String bucketName, String keyPrefix, File destinationDirectory, boolean resumeOnRetry, KeyFilter filter)`
- `downloadDirectory(String bucketName, String keyPrefix, File destinationDirectory, KeyFilter filter)`

```
// V1
 ----------------------------------------------------------------------------------------
KeyFilter filter = new KeyFilter() {
            @Override
            public boolean shouldInclude(S3ObjectSummary objectSummary) {
                //Filter implementation
            }
        };
MultipleFileDownload multipleFileDownload = tm.downloadDirectory(bucketName, keyPrefix,
 destinationDirectory, filter);

// V2
 ----------------------------------------------------------------------------------------
// The v2 SDK does not have a direct equiavalent to the `resumeOnRetry` method of v1.
```

```
// If a download is interrupted, you need to start a new download request.
DownloadFilter filter = new DownloadFilter() {
            @Override
            public boolean test(S3Object s3Object) {
                // Filter implementation.
            }
        };

DownloadDirectoryRequest downloadDirectoryRequest =
                                DownloadDirectoryRequest.builder()
                                    .bucket(bucketName)
                                    .filter(filter)
                                    .listObjectsV2RequestTransformer(builder ->
 builder.prefix(keyPrefix))
                                    .destination(destinationDirectory.toPath())
                                    .build();

DirectoryDownload directoryDownload =
 transferManager.downloadDirectory(downloadDirectoryRequest);
```

upload method with `ObjectMetadata` parameter

- upload(String bucketName, String key, InputStream input, ObjectMetadata objectMetadata)

```
// V1
 ----------------------------------------------------------------------------------------------
ObjectMetadata metadata = new ObjectMetadata();
ObjectMetadata metadata = new ObjectMetadata();

metadata.setContentType("text/plain");        // System-defined metadata
metadata.setContentLength(22L);               // System-defined metadata
metadata.addUserMetadata("myKey", "myValue"); // User-defined metadata

PutObjectRequest putObjectRequest = new PutObjectRequest(bucketName, key, inputStream,
 metadata);

Upload upload = transferManager.upload("amzn-s3-demo-bucket", "my-key", inputStream,
 metadata);

// V2
 ----------------------------------------------------------------------------------------------
```

```
/* When you use an InputStream to upload in V2, you should specify the content length
   and use `RequestBody.fromInputStream()`.
   If you don't provide the content length, the entire stream will be buffered in
 memory.
   If you can't determine the content length, we recommend using the CRT-based S3
 client.
*/
Map<String, String> userMetadata = new HashMap<>();
userMetadata.put("x-amz-meta-myKey", "myValue");

PutObjectRequest putObjectRequest =
                        PutObjectRequest.builder()
                            .bucket("amzn-s3-demo-bucket1")
                            .key("k")
                            .contentType("text/plain") //System-defined metadata
 usually has separate methods in the builder.
                            .contentLength(22L)
                            .metadata(userMetadata) //metadata() is only for user-
defined metadata.
                            .build();

UploadRequest uploadRequest =
                        UploadRequest.builder()
                            .putObjectRequest(putObjectRequest)
                            .requestBody(AsyncRequestBody.fromInputStream(stream, 22L,
 executor))
                            .build();

transferManager.upload(uploadRequest).completionFuture().join();
```

`uploadDirectory` with `ObjectMetadataProvider` parameter

- uploadDirectory(String bucketName, String virtualDirectoryKeyPrefix, File directory, boolean includeSubdirectories, ObjectMetadataProvider metadataProvider)
- uploadDirectory(String bucketName, String virtualDirectoryKeyPrefix, File directory, boolean includeSubdirectories, ObjectMetadataProvider metadataProvider, ObjectTaggingProvider taggingProvider)
- uploadDirectory(String bucketName, String virtualDirectoryKeyPrefix, File directory, boolean includeSubdirectories, ObjectMetadataProvider

```
 metadataProvider, ObjectTaggingProvider taggingProvider,
 ObjectCannedAclProvider cannedAclProvider)
```

```
// V1
 ---------------------------------------------------------------------------------------------
tm.uploadDirectory(bucketName, virtualDirectoryKeyPrefix, directory,
 includeSubdirectories, metadataProvider)
tm.uploadDirectory(bucketName, virtualDirectoryKeyPrefix, directory,
 includeSubdirectories, metadataProvider, taggingProvider)
tm.uploadDirectory(bucketName, virtualDirectoryKeyPrefix, directory,
 includeSubdirectories, metadataProvider, taggingProvider, cannedAclProvider)

// V2
 ---------------------------------------------------------------------------------------------
UploadDirectoryRequest request = UploadDirectoryRequest.builder()
                                    .bucket(bucketName)
                                    .s3Prefix(virtualDirectoryKeyPrefix)
                                    .source(directory.toPath())
                                    .maxDepth(includeSubdirectories ? Integer.MAX_VALUE :
 1)
                                    .uploadFileRequestTransformer(builder -> {
                                        // 1.Replace `ObjectMetadataProvider`,
 `ObjectTaggingProvider`, and `ObjectCannedAclProvider` with an
                                          // `UploadFileRequestTransformer` that can
 combine the functionality of all three *Provider implementations.
                                          // 2. Convert your v1 `ObjectMetadata` to v2
 `PutObjectRequest` parameters.
                                          // 3. Convert your v1 `ObjectTagging` to v2
 `Tagging`.
                                          // 4. Convert your v1 `CannedAccessControlList`
 to v2 `ObjectCannedACL`.
                                    })
                                    .build();

DirectoryUpload directoryUpload = transferManager.uploadDirectory(request);
```

Model object migration

In AWS SDK for Java 2.x, many of the `TransferManager` model objects have been redesigned, and several getter and setter methods available in v1's model objects are no longer supported.

In v2, you can use the `CompletableFuture<T>` class to perform actions when the transfer completes—either successfully or with an exception. You can use the `join()` method to wait for completion if needed.

Core transfer objects

V1 class	V2 class	Migration status
`TransferManager`	`S3TransferManager`	Supported
`TransferManagerBuilder`	`S3TransferManager.Builder`	Supported
`Transfer`	`Transfer`	Supported
`AbortableTransfer`	`Transfer`	Supported (no separate class)
`Copy`	`Copy`	Supported
`Download`	`FileDownload`	Supported
`Upload`	`Upload` / `FileUpload`	Supported
`MultipleFileDownload`	`DirectoryDownload`	Supported
`MultipleFileUpload`	`DirectoryUpload`	Supported

Persistence objects

V1 class	V2 class	Migration status
`PersistableDownload`	`ResumableFileDownload`	Supported
`PersistableUpload`	`ResumableFileUpload`	Supported
`PersistableTransfer`	`ResumableTransfer`	Supported
`PauseResult<T>`	Direct resumable object	Not Supported

Result objects

V1 class	V2 class	Migration status
`CopyResult`	`CompletedCopy`	Supported
`UploadResult`	`CompletedUpload`	Supported

Configuration objects

V1 class	V2 class	Migration status
`TransferManagerConfiguration`	`MultipartConfiguration` (on Amazon S3 client)	Supported
`TransferProgress`	`TransferProgress` + `TransferProgressSnapshot`	Supported
`KeyFilter`	`DownloadFilter`	Supported

Unsupported objects

V1 class	V2 alternative	Migration status
`PauseStatus`	Not supported	Not Supported
`UploadContext`	Not supported	Not Supported
`ObjectCannedAclProvider`	`PutObjectRequest.builder().acl()`	Not Supported
`ObjectMetadataProvider`	`PutObjectRequest.builder().metadata()`	Not Supported
`ObjectTaggingProvider`	`PutObjectRequest.builder().tagging()`	Not Supported

V1 class	V2 alternative	Migration status
`PresignedUrlDownload`	Not supported	Not Supported

TransferManagerBuilder configuration migration

Configuration changes

The configuration changes that you need to set for the v2 transfer manager depend on which S3 client that you use. You have the choice of the AWS CRT-based S3 client or the standard Java-based S3 async client. For information about the differences, see the the section called “S3 clients in the SDK” topic.

Use the AWS CRT-based S3 client

Setting	v1	v2 - Transfer Manager using AWS CRT-based S3 client
(get a builder)	`TransferManagerBuilder tmBuilder = TransferManagerBuilder.standard();`	`S3TransferManager.Builder tmBuilder = S3TransferManager.builder();`
S3 client	`tmBuilder.withS3Client(...); tmBuilder.setS3Client(...);`	`tmBuilder.s3Client(...);`
Executor	`tmBuilder.withExecutorFactory(...); tmBuilder.setExecutorFactory(...);`	`tmBuilder.executor(...);`
Shutdown thread pools	`tmBuilder.withShutDownThreadPools(...);`	Not supported. The provided executor will not be shut down when the `S3TransferManager` is closed

Setting	v1	v2 - Transfer Manager using AWS CRT-based S3 client
	`tmBuilder.setShutdownThreadPools(...);`	

Minimum upload part size	`tmBuilder.withMinimumUploadPartSize(...);`
	`tmBuilder.setMinimumUploadPartSize(...);`
		`S3AsyncClient s3 = S3AsyncClient.crtBuilder().minimumPartSizeInBytes(...).build();`
		
		`tmBuilder.s3Client(s3);`

Multipart upload threshold	`tmBuilder.withMinimumUploadPartSize(...);`
	`tmBuilder.setMinimumUploadPartSize(...);`
		`S3AsyncClient s3 = S3AsyncClient.crtBuilder().thresholdInBytes(...).build();`
		
		`tmBuilder.s3Client(s3);`

Minimum copy part size	`tmBuilder.withMinimumUploadPartSize(...);`
	`tmBuilder.setMinimumUploadPartSize(...);`
		`S3AsyncClient s3 = S3AsyncClient.crtBuilder().minimumPartSizeInBytes(...).build();`
		
		`tmBuilder.s3Client(s3);`

Setting	v1	v2 - Transfer Manager using AWS CRT-based S3 client

Multipart copy threshold	`tmBuilder.withMinimumUploadPartSize(...);`
	`tmBuilder.setMinimumUploadPartSize(...);`
		`S3AsyncClient s3 = S3AsyncClient.crtBuilder().`
		`threshold InBytes(...).build();`
		
		`tmBuilder.s3Client(s3);`

Disable parallel downloads	`tmBuilder.withDisableParallelDownloads(...);`
	`tmBuilder.setDisableParallelDownloads(...);`
		Disable parallel downloads by passing a standard Java-based S3 client **with multipart disabled (default)** to the transfer manager.
		
		`S3AsyncClient s3 = S3AsyncClient.builder().build();`
		
		`tmBuilder.s3Client(s3);`

Always calculate multipart md5	`tmBuilder.withAlwaysCalculateMultipartMd5(...);` `tmBuilder.setAlwaysCalculateMultipartMd5(...);`	Not supported.

Use Java-based S3 async client

Setting	v1	v2 - Transfer Manager using Java-based S3 async client
(get a builder)	`TransferManagerBuilder tmBuilder = TransferManagerBuilder.standard();`	`S3TransferManager.Builder tmBuilder = S3TransferManager.builder();`
S3 client	`tmBuilder.withS3Client(...); tmBuilder.setS3Client(...);`	`tmBuilder.s3Client(...);`
Executor	`tmBuilder.withExecutorFactory(...); tmBuilder.setExecutorFactory(...);`	`tmBuilder.executor(...);`
Shutdown thread pools	`tmBuilder.withShutDownThreadPools(...); tmBuilder.setShutdownThreadPools(...);`	Not supported. The provided executor will not be shut down when the `S3TransferManager` is closed
Minimum upload part size	`tmBuilder.withMinimumUploadPartSize(...); tmBuilder.setMinimumUploadPartSize(...);`	`S3AsyncClient s3 = S3AsyncClient.builder() .multipartConfiguration(cfg -> cfg.minimumPartSizeInBytes(...)).build(); tmBuilder.s3Client(s3);`

Setting	v1	v2 - Transfer Manager using Java-based S3 async client

Multipart upload threshold	`tmBuilder.withMinimumUploadPartSize(...);`
	`tmBuilder.setMinimumUploadPartSize(...);`
		`S3AsyncClient s3 = S3AsyncClient.builder()`
		`.multipartConfiguration(cfg -> cfg.thresholdInBytes(...)).build();`
		
		`tmBuilder.s3Client(s3);`

Minimum copy part size	`tmBuilder.withMinimumUploadPartSize(...);`
	`tmBuilder.setMinimumUploadPartSize(...);`
		`S3AsyncClient s3 = S3AsyncClient.builder()`
		`.multipartConfiguration(cfg -> cfg.minimumPartSizeInBytes(...)).build();`
		
		`tmBuilder.s3Client(s3);`

Multipart copy threshold	`tmBuilder.withMinimumUploadPartSize(...);`
	`tmBuilder.setMinimumUploadPartSize(...);`
		`S3AsyncClient s3 = S3AsyncClient.builder()`
		`.multipartConfiguration(cfg -> cfg.thresholdInBytes(...)).build();`
		
		`tmBuilder.s3Client(s3);`

Setting	v1	v2 - Transfer Manager using Java-based S3 async client

Disable parallel downloads	`tmBuilder.withDisableParallelDownloads(...);`
	`tmBuilder.setDisableParallelDownloads(...);`
		Disable parallel downloads by passing a standard Java-based S3 client **with multipart disabled (default)** to the transfer manager.
		`S3AsyncClient s3 = S3AsyncClient.builder().build();`
		`tmBuilder.s3Client(s3);`

Always calculate multipart md5	`tmBuilder.withAlwaysCalculateMultipartMd5(...);` `tmBuilder.setAlwaysCalculateMultipartMd5(...);`	Not supported.

Behavior changes

Asynchronous operations

V1 (blocking):

```
Upload upload = transferManager.upload("amzn-s3-demo-bucket", "key", file);
upload.waitForCompletion(); // Blocks until complete
```

V2 (asynchronous):

```
FileUpload upload = transferManager.uploadFile(UploadFileRequest.builder()
    .putObjectRequest(PutObjectRequest.builder()
        .bucket("amzn-s3-demo-bucket")
        .key("key")
        .build())
```

```
    .source(file)
    .build());

CompletedFileUpload result = upload.completionFuture().join(); // Blocks until complete
// Or handle asynchronously:
upload.completionFuture().thenAccept(result -> {
    System.out.println("Upload completed: " + result.response().eTag());
});
```

Error handling

V1: Directory transfers fail completely if any sub-request fails.

V2: Directory transfers complete successfully even if some sub-requests fail. Check for errors explicitly:

```
DirectoryUpload directoryUpload = transferManager.uploadDirectory(request);
CompletedDirectoryUpload result = directoryUpload.completionFuture().join();

// Check for failed transfers
if (!result.failedTransfers().isEmpty()) {
    System.out.println("Some uploads failed:");
    result.failedTransfers().forEach(failed ->
        System.out.println("Failed: " + failed.exception().getMessage()));
}
```

Parallel download via byte-range fetches

When the automatic parallel transfer feature is enabled in the v2 SDK, the S3 Transfer Manager uses byte-range fetches to retrieve specific portions of the object in parallel (multipart download). The way an object is downloaded with v2 does not depend on how the object was originally uploaded. All downloads can benefit from high throughput and concurrency.

In contrast, with v1's Transfer Manager, it does matter how the object was originally uploaded. The v1 Transfer Manager retrieves the parts of the object the same way that the parts were uploaded. If an object was originally uploaded as a single object, the v1 Transfer Manager is not able to accelerate the downloading process by using sub-requests.

Changes in parsing Amazon S3 URIs from version 1 to version 2

This topic details the changes in parsing Amazon S3 URIs from version 1 (v1) to version 2 (v2.).

High-level changes

To begin parsing an S3 URI in v1, you instantiate an `AmazonS3URI` by using a constructor. In v2 you call `parseUri()` on an instance of `S3Utilities`, to return an `S3URI`.

Change	v1	v2

Maven dependencies	`<dependencyManagement>`
	`  <dependencies>`
	`  <dependency>`
	`  <groupId>com.amazonaws</groupId>`

		`  <artifactId>s3</artifactId>`
		`  </dependency>`
		`</dependencies>`

Package name	`com.amazonaws.services.s3`	`software.amazon.awssdk.services.s3`
Class names	`AmazonS3URI`	`S3URI`

[1] Latest version. [2] Latest version.

API changes

Behavior	v1	v2

Parse an S3 URI.	`URI uri = URI.creat e( "https://s3.amazon aws.com");`
	
	`AmazonS3Uri s3Uri = new AmazonS3U RI(uri, false);`
		`S3Client s3Client = S3Client.create(); S3Utilities s3Utiliti es = s3Client.utilities ();`
		
		`S3Uri s3Uri = s3Utilities.parseU ri(uri);`

Retrieve the bucket name from an S3 URI.	`String bucket = s3Uri.getBucket();`	`Optional<String> bucket = s3Uri.bucket();`
Retrieve the key.	`String key = s3Uri.get Key();`	`Optional<String> key = s3Uri.key();`

Retrieve the region.	`String region = s3Uri.getRegion();`	`Optional<Region> region = s3Uri.region();`
		
		`String region; if (s3Uri.region().is Present()) { region = s3Uri.reg ion().get().id(); }`

Retrieve whether the S3 URI is path style.	`boolean isPathStyle = s3Uri.isPathStyle();`	`boolean isPathStyle = s3Uri.isPathStyle();`
Retrieve the version ID.	`String versionId = s3Uri.getVersionId();`	`Optional<String> versionId =`

Behavior	v1	v2
		`s3Uri.firstMatchingRawQueryParameter("versionId");`
Retrieve the query parameters.	N/A	`Map<String, List<String>> queryParams = s3Uri.rawQueryParameters();`

Behavior changes

URL encoding

v1 provides the option to pass in a flag to specify whether the URI should be URL encoded. The default value is `true`.

In v2, URL encoding is not supported. If you work with object keys or query parameters that have reserved or unsafe characters, you must URL encode them. For example you need to replace a whitespace `" "` with `%20`.

Changes in the S3 Event Notifications API from version 1 to version 2

This topic details the changes in the S3 Event Notifications API from version 1.x (v1) to version 2 .x (v2) of the AWS SDK for Java.

High-level changes

Structural changes

V1 uses static inner classes for `EventNotificationRecord` types and their attributes, whereas v2 uses separate public classes for `EventNotificationRecord` types.

Naming convention changes

In v1, attribute class names include the suffix *Entity*, whereas v2 omits this suffix for simpler naming: for example, *eventData* instead of *eventDataEntity*.

Changes in dependencies, packages and class names

In v1, S3 Event Notification API classes are transitively imported with along with the S3 module (artifactId `aws-java-sdk-s3`). However, in v2, you need to add a dependency on the `s3-event-notifications` artifact.

Change	v1	v2
Maven dependencies	`<dependencyManagement> <dependencies> <dependency> <groupId> com.amazonaws</groupId> <artifactId>aws-java-sdk-bom</artifactId> <version> 1.X.X</version> <type>pom</type> <scope>import</scope> </dependency> </dependencies> </dependencyManagement> <dependencies> <dependency> <groupId> com.amazonaws</groupId> <artifactId>aws-java-sdk-s3</artifactId> </dependency> </dependencies>`	`<dependencyManagement> <dependencies> <dependency> <groupId> software.amazon.awssdk</groupId> <artifactId>bom</artifactId> <version> 2.X.X[1]</version> <type>pom</type> <scope>import</scope> </dependency> </dependencies> </dependencyManagement> <dependencies> <dependency> <groupId> software.amazon.awssdk</groupId> <artifactId>s3-event-notifications</artifactId> </dependency> </dependencies>`
Package name	`com.amazonaws.services.s3.event`	`software.amazon.awssdk.eventnotifications.s3.model`

Change	v1	v2
Class names	S3EventNotification S3EventNotification.S3EventNotificationRecord S3EventNotification.GlacierEventDataEntity S3EventNotification.IntelligentTieringEventDataEntity S3EventNotification.LifecycleEventDataEntity S3EventNotification.ReplicationEventDataEntity S3EventNotification.RequestParametersEntity S3EventNotification.ResponseElementsEntity S3EventNotification.RestoreEventDataEntity S3EventNotification.S3BucketEntity S3EventNotification.S3Entity S3EventNotification.S3ObjectEntity S3EventNotification.TransitionEventDataEntity	S3EventNotification S3EventNotificationRecord GlacierEventData IntelligentTieringEventData LifecycleEventData ReplicationEventData RequestParameters ResponseElements RestoreEventData S3Bucket S3 S3Object TransitionEventData UserIdentity

Change	v1	v2
	S3EventNotification.UserIdentityEntity	

[1] Latest version.

API changes

JSON to `S3EventNotification` and reverse

Use case	v1	v2
Create `S3EventNotification` from JSON String	`S3EventNotification notification = S3EventNotification.parseJson(message.body());`	`S3EventNotification notification = S3EventNotification.fromJson(message.body());`
Convert `S3EventNotification` to JSON String	`String json = notification.toJson();`	`String json = notification.toJson();`

Access attributes of `S3EventNotification`

Use case	v1	v2
Retrieve records from a notification	`List<S3EventNotification.S3EventNotificationRecord> records = notifcation.getRecords();`	`List<S3EventNotificationRecord> records = notification.getRecords();`
Retrieve a record from a list of records	`S3EventNotification.S3EventNotificationRecord record =`	`S3EventNotificationRecord record =`

Use case	v1	v2
	`records.stream().findAny().get();`	`records.stream().findAny().get();`
Retrieve Glacier event data	`S3EventNotification.GlacierEventDataEntity glacierEventData = record.getGlacierEventData();`	`GlacierEventData glacierEventData = record.getGlacierEventData();`
Retrieve restore event data from a Glacier event	`S3EventNotification.RestoreEventDataEntity restoreEventData = glacierEventData.getRestoreEventDataEntity();`	`RestoreEventData restoreEventData = glacierEventData.getRestoreEventData();`
Retrieve request parameters	`S3EventNotification.RequestParametersEntity requestParameters = record.getRequestParameters();`	`RequestParameters requestParameters = record.getRequestParameters();`
Retrieve Intelligent Tiering event data	`S3EventNotification.IntelligentTieringEventDataEntity tieringEventData = record.getIntelligentTieringEventData();`	`IntelligentTieringEventData intelligentTieringEventData = record.getIntelligentTieringEventData();`
Retrieve lifecyle event data	`S3EventNotification.LifecycleEventDataEntity lifecycleEventData = record.getLifecycleEventData();`	`LifecycleEventData lifecycleEventData = record.getLifecycleEventData();`

Use case	v1	v2
Retrieve event name as enum	`S3Event eventNameAsEnum = record.getEventNameAsEnum();`	`//getEventNameAsEnum does not exist; use 'getEventName()' String eventName = record.getEventName();`
Retrieve replication event data	`S3EventNotification.ReplicationEventDataEntity replicationEntity = record.getReplicationEventDataEntity();`	`ReplicationEventData replicationEventData = record.getReplicationEventData();`
Retrieve S3 bucket and object information	`S3EventNotification.S3Entity s3 = record.getS3();`	`S3 s3 = record.getS3();`
Retrieve user identity information	`S3EventNotification.UserIdentityEntity userIdentity = record.getUserIdentity();`	`UserIdentity userIdentity = record.getUserIdentity();`
Retrieve response elements	`S3EventNotification.ResponseElementsEntity responseElements = record.getResponseElements();`	`ResponseElements responseElements = record.getResponseElements();`

Migrate the `aws-lambda-java-events` library version

If you use aws-lambda-java-events to work with S3 notification events within a Lambda function, we recommend that you upgrade to the latest 3.x.x version. Recent versions eliminate all dependencies on AWS SDK for Java 1.x from the S3 event notification API.

For more information about the differences in handling S3 event notifications between the `aws-lambda-java-events` library and the SDK for Java 2.x, see the section called "S3 event notification handling options".

Profile file changes

The AWS SDK for Java 2.x parses the profile definitions in `~/.aws/config` and `~/.aws/credentials` to more closely emulate the way the AWS CLI parses the files.

The SDK for Java 2.x:

- Resolves a `~/` or `~` followed by the file system's default path separator at the start of the path by checking, in order, `$HOME`, `$USERPROFILE` (Windows only), `$HOMEDRIVE`, `$HOMEPATH` (Windows only), and then the `user.home` system property.
- Looks for the `AWS_SHARED_CREDENTIALS_FILE` environment variable instead of `AWS_CREDENTIAL_PROFILES_FILE`.
- Silently drops profile definitions in configuration files without the word `profile` at the beginning of the profile name.
- Silently drops profile definitions that do not consist of alphanumeric, underscore or dash characters (after the leading `profile` word has been removed for configuration files).
- Merges settings of profile definitions duplicated within the same file.
- Merges settings of profile definitions duplicated in both the configuration and credentials files.
- Does NOT merge settings if both `[profile foo]` and `[foo]` are found in the same file.
- Uses settings in `[profile foo]` if both `[profile foo]` and `[foo]` are found in the configuration file.
- Uses the value of the last duplicated setting in the same file and profile.
- Recognizes both `;` and # for defining a comment.
- Recognizes `;` and # in profile definitions to define a comment, even if the characters are adjacent to the closing bracket.
- Recognizes `;` and # to define a comment only in setting values only if they are preceded by whitespace.
- Recognizes `;` and # and all following content in setting values if they are not preceded by whitespace.
- Considers role-based credentials the highest-priority credentials. The 2.x SDK always uses role-based credentials if the user specifies the `role_arn` property.

- Considers session-based credentials the second-highest-priority credentials. The 2.x SDK always uses session-based credentials if role-based credentials were not used and the user specifies the `aws_access_key_id` and `aws_session_token` properties.
- Uses basic credentials if role-based and session-based credentials are not used and the user specified the `aws_access_key_id` property.

Environment variables and system properties changes

Changes in Waiters from version 1 to version 2

This topic details the changes in the functionality of Waiters from version 1 (v1) to version 2 (v2).

The following tables demonstrate the difference for DynamoDB waiters specifically. Waiters for other services follow the same pattern.

High-level changes

Waiters classes are in the same Maven artifact as the service.

Change	v1	v2

		`    "Table creation`
		` succeeded");`
		`               }`
		`           }).join();`

Change	v1	v2
	}).get();	

Configuration changes

Change	v1	v2

Polling Strategy (max attempts and fixed delay)	`MaxAttemptsRetryStrategy maxAttemptsRetryStrategy = new MaxAttemptsRetryStrategy(10);`
	
	`FixedDelayStrategy fixedDelayStrategy = new FixedDelayStrategy(3);`
	
	`PollingStrategy pollingStrategy = new PollingStrategy(maxAttemptsRetryStrategy, fixedDelayStrategy);`
	
	`waiter.tableExists().run( new WaiterParameters<>( new DescribeTableRequest(tableName)), pollingStrategy);`
		`FixedDelayBackoffStrategy fixedDelayBackoffStrategy = FixedDelayBackoffStrategy .create(Duration.ofSeconds(3));`
		
		`waiter.waitUntilTableExists(r -> r.tableName(tableName), c -> c.maxAttempts(10) .backoffStrategy(fixedDelayBackoffStrategy));`

Changes in the EC2 metadata utility from version 1 to version 2

This topic details the changes in the SDK for Java Amazon Elastic Compute Cloud (EC2) metadata utility from version 1 (v1) to version 2 (v2).

High-level changes

Change	v1	v2
Maven dependencies	<dependencyManagement> <dependencies> <dependency> <groupId> com.amazonaws</gro upId> <artifact Id>aws-java-sdk-bom</ artifactId> <version> *1.12.587*[1]</version> <type>pom</ type> <scope>im port</scope> </dependency> </dependencies> </dependencyManageme nt> <dependencies> <dependency> <groupId> com.amazonaws</gro upId> <artifact Id>aws-java-sdk-co re</artifactId> </dependency> </dependencies>	<dependencyManagement> <dependencies> <dependency> <groupId> software.amazon.aw ssdk</groupId> <artifact Id>bom</artifactId> <version> *2.27.21*[2]</version> <type>pom</ type> <scope>im port</scope> </dependency> </dependencies> </dependencyManageme nt> <dependencies> <dependency> <groupId> software.amazon.aw ssdk</groupId> <artifact Id>imds</artifactId> </dependency> <dependency> <groupId> software.amazon.aw ssdk</groupId> <artifact Id>apache-client [3]</ artifactId>

Change	v1	v2
		`</dependency>` `</dependencies>`
Package name	`com.amazonaws.util`	`software.amazon.awssdk.imds`

Instantiation approach	Use static utility methods; no instantiation:
	`String localHostName = EC2MetadataUtils.getLocalHostName();`
		Use a static factory method:
		`Ec2MetadataClient client = Ec2MetadataClient.create();`
		Or use a builder approach:
		`Ec2MetadataClient client = Ec2MetadataClient.builder().endpointMode(EndpointMode.IPV6).build();`

Types of clients	Synchronous only utility methods: `EC2MetadataUtils`	Synchronous: `Ec2MetadataClient` Asynchronous: `Ec2MetadataAsyncClient`

[1] Latest version. [2] Latest version.

[3]Notice the declaration of the `apache-client` module for v2. V2 of the EC2 metadata utility requires an implementation of the `SdkHttpClient` interface for the synchronous metadata client, or the `SdkAsyncHttpClient` interface for the asynchronous metadata client. The ??? section shows the list of HTTP clients that you can use.

Requesting metadata

In v1, you use static methods that accept no parameters to request metadata for an EC2 resource. In contrast, you need to specify the path to the EC2 resource as a parameter in v2. The following table shows the different approaches.

v1	v2

`String userMetaData = EC2MetadataUtils.getUserData();`	`Ec2MetadataClient client = Ec2MetadataClient.create();`
	`Ec2MetadataResponse response = client.get("/latest/user-data");`
	`String userMetaData = response.asString();`

Refer to the instance metadata categories to find the path you need to supply to request a piece of metadata.

> **Note**
>
> When you use an instance metadata client in v2, you should aim to use the same client for all request to retrieve metadata.

Behavior changes

JSON data

On EC2, the locally running Instance Metadata Service (IMDS) returns some metadata as JSON formatted strings. One such example is the dynamic metadata of an instance identity document.

The v1 API contains separate methods for each piece of instance identity metadata, whereas the v2 API directly returns the JSON string. To work with the JSON string, you can use the Document API to parse the response and navigate the JSON structure.

The following table compares how you retrieve metadata of an instance identity document in v1 and v2.

Use case	v1	v2
Retrieve the Region	`InstanceInfo instanceInfo = EC2MetadataUtils.getInstanceInfo(); String region = instanceInfo.getRegion();`	`Ec2MetadataResponse response = client.get("/latest/dynamic/instance-identity/document"); Document instanceInfo = response.asDocument(); String region = instanceInfo.asMap().get("region").asString();`
Retrieve the instance id	`InstanceInfo instanceInfo = EC2MetadataUtils.getInstanceInfo(); String instanceId = instanceInfo.instanceId;`	`Ec2MetadataResponse response = client.get("/latest/dynamic/instance-identity/document"); Document instanceInfo = response.asDocument(); String instanceId = instanceInfo.asMap().get("instanceId").asString();`
Retrieve the instance type	`InstanceInfo instanceInfo = EC2MetadataUtils.getInstanceInfo(); String instanceType = instanceInfo.instanceType();`	`Ec2MetadataResponse response = client.get("/latest/dynamic/instance-identity/document"); Document instanceInfo = response.asDocument(); String instanceType = instanceInfo.asMap().get("instanceType").asString();`

Endpoint resolution differences

The following table shows the locations that the SDK checks to resolve the endpoint to IMDS. The locations are listed in descending priority.

v1	v2
System property: `com.amazonaws.sdk.ec2MetadataServiceEndpointOverride`	Client builder configuration method: `endpoint(...)`
Environment variable: `AWS_EC2_METADATA_SERVICE_ENDPOINT`	System property: `aws.ec2MetadataServiceEndpoint`
Default Value: `http://169.254.169.254`	Config file: `~.aws/config` with the `ec2_metadata_service_endpoint` setting
	Value associated with resolved `endpoint-mode`
	Default value: `http://169.254.169.254`

Endpoint resolution in v2

When you explicitly set an endpoint by using the builder, that endpoint value takes priority over all other settings. When the following code executes, the `aws.ec2MetadataServiceEndpoint` system property and config file `ec2_metadata_service_endpoint` setting are ignored if they exist.

```
Ec2MetadataClient client = Ec2MetadataClient
  .builder()
  .endpoint(URI.create("endpoint.to.use"))
  .build();
```

Endpoint-mode

With v2, you can specify an endpoint-mode to configure the metadata client to use the default endpoint values for IPv4 or IPv6. Endpoint-mode is not available for v1. The default value used for IPv4 is `http://169.254.169.254` and `http://[fd00:ec2::254]` for IPv6.

The following table shows the different ways that you can set the endpoint mode in order of descending priority.

		Possible values
Client builder configuration method: `endpointMode(...)`	`Ec2MetadataClient client = Ec2MetadataClient.builder().endpointMode(EndpointMode.IPV4).build();`	`EndpointMode.IPV4` , `EndpointMode.IPV6`
System property	`aws.ec2MetadataServiceEndpointMode`	`IPv4`, `IPv6` (case does not matter)
Config file: `~.aws/config`	`ec2_metadata_service_endpoint` setting	`IPv4`, `IPv6` (case does not matter)
Not specified in the previous ways	IPv4 is used	

How the SDK resolves `endpoint` or `endpoint-mode` in v2

1. The SDK uses the value that you set in code on the client builder and ignores any external settings. Because the SDK throws an exception if both `endpoint` and `endpointMode` are called on the client builder, the SDK uses the endpoint value from whichever method you use.
2. If you do not set a value in code, the SDK looks to external configuration—first for system properties and then for a setting in the config file.
   a. The SDK first checks for an endpoint value. If a value is found, it is used.
   b. If the SDK still hasn't found a value, the SDK looks for endpoint mode settings.

3. Finally, if the SDK finds no external settings and you have not configured the metadata client in code, the SDK uses the IPv4 value of `http://169.254.169.254`.

IMDSv2

Amazon EC2 defines two approaches to access instance metadata:

- Instance Metadata Service Version 1 (IMDSv1) – Request/response approach
- Instance Metadata Service Version 2 (IMDSv2) – Session-oriented approach

The following table compares how the Java SDKs work with IMDS.

v1	v2
IMDSv2 is used by default	Always uses IMDSv2
Attempts to fetch a session token for each request and falls back to IMDSv1 if it fails to fetch a session token	Keeps a session token in an internal cache that is reused for multiple requests

The SDK for Java 2.x supports only IMDSv2 and does not fall back to IMDSv1.

Configuration differences

The following table lists the differing configuration options.

Configuration	v1	v2
Retries	Configuration not available	Configurable through builder method `retryPolicy(...)`
HTTP	Connection timeout configurable through the `AWS_METADATA_SERVICE_TIMEOUT` environment variable. The default is 1 second.	Configuration available by passing an HTTP client to the builder method `httpClient(...)` . The default

Configuration	v1	v2
		connection timeout for HTTP clients is 2 seconds.

Example v2 HTTP configuration

The following example shows how you can configure the metadata client. This example configures the connection timeout and uses the Apache HTTP client.

```
SdkHttpClient httpClient = ApacheHttpClient.builder()
    .connectionTimeout(Duration.ofSeconds(1))
    .build();

Ec2MetadataClient imdsClient = Ec2MetadataClient.builder()
    .httpClient(httpClient)
    .build();
```

Changes in Amazon CloudFront presigning from version 1 to version 2

This topic details the changes in the Amazon CloudFront from version 1 (v1) to version 2 (v2).

High-level changes

Change	v1	v2
Maven dependencies	`<dependencyManagement> <dependencies> <dependency> <groupId> com.amazonaws</groupId> <artifactId>aws-java-sdk-bom</artifactId> <version> 1.12.587[1]</version> <type>pom</type>`	`<dependencyManagement> <dependencies> <dependency> <groupId> software.amazon.awssdk</groupId> <artifactId>bom</artifactId> <version> 2.27.21[2]</version> <type>pom</type> <scope>import</scope>`

Change	v1	v2
	<scope>import</scope> </dependency> </dependencies> </dependencyManagement> <dependencies> <dependency> <groupId>com.amazonaws</groupId> <artifactId>cloudfront</artifactId> </dependency> </dependencies>	</dependency> </dependencies> </dependencyManagement> <dependencies> <dependency> <groupId>software.amazon.awssdk</groupId> <artifactId>cloudfront</artifactId> </dependency> </dependencies>
Package name	`com.amazonaws.services.cloudfront`	`software.amazon.awssdk.services.cloudfront`
Class names	CloudFrontUrlSigner CloudFrontCookieSigner	CloudFrontUtilities SignedUrl CannedSignerRequest CustomSignerRequest

[1] Latest version. [2] Latest version.

API changes

Behavior	v1	v2
Build a canned request	Arguments are passed directly to the API.	`CannedSignerRequest cannedRequest = CannedSignerRequest.builder()`

Behavior	v1	v2

		`.resourceUrl(resourceUrl)`
		`.privateKey(privateKey)`
		`.keyPairId(keyPairId)`
		`.expirationDate(expirationDate)`
		`.build();`

Build a custom request	Arguments are passed directly to the API.	`CustomSignerRequest customRequest = CustomSignerRequest.builder()`
		`.resourceUrl(resourceUrl)`
		`.resourceUrlPattern(resourceUrlPattern)`
		`.privateKey(keyFile)`
		`.keyPairId(keyPairId)`
		`.expirationDate(expirationDate)`
		`.activeDate(activeDate)`
		`.ipRange(ipRange)`
		`.build();`

Behavior	v1	v2

Generate a signed URL (canned)	`String signedUrl = CloudFrontUrlSigner.getSignedURLWithCannedPolicy( resourceUrl, keyPairId, privateKey, expirationDate);`	`CloudFrontUtilities cloudFrontUtilities = CloudFrontUtilities.create();`
		
		`SignedUrl signedUrl =`
		
		`cloudFrontUtilities.getSignedUrlWithCannedPolicy(cannedRequest);`
		
		`String url = signedUrl.url();`

Generate a signed cookie (custom)	`CookiesForCustomPolicy cookies = CloudFrontCookieSigner.getCookiesForCustomPolicy( resourceUrl, privateKey, keyPairId, expirationDate, activeDate, ipRange);`	`CloudFrontUtilities cloudFrontUtilities = CloudFrontUtilities.create();`
		
		`CookiesForCustomPolicy cookies = cloudFrontUtilities.getCookiesForCustomPolicy(customRequest);`

Refactored cookie headers in v2

In Java v1, the Java SDK delivers cookie headers as a `Map.Entry<String, String>`.

```
Map.Entry<String, String> signatureMap = cookies.getSignature();
String signatureKey = signatureMap.getKey(); // "CloudFront-Signature"
String signatureValue = signatureMap.getValue(); // "[SIGNATURE_VALUE]"
```

The Java v2 SDK delivers the entire header as a single `String`.

```
String signatureHeaderValue = cookies.signatureHeaderValue(); // "CloudFront-
Signature=[SIGNATURE_VALUE]"
```

Changes in the IAM Policy Builder API from version 1 to version 2

This topic details the changes in the IAM Policy Builder API from version 1 (v1) to version 2 (v2).

High-level changes

Change	v1	v2
Maven dependencies	<dependencyManagement> <dependencies> <dependency> <groupId> com.amazonaws</gro upId> <artifact Id>aws-java-sdk-bom</ artifactId> <version> *1.12.587*[1]</version> <type>pom</ type> <scope>im port</scope> </dependency> </dependencies> </dependencyManageme nt> <dependencies> <dependency> <groupId> com.amazonaws</gro upId> <artifact Id>aws-java-sdk-co re</artifactId> </dependency> </dependencies>	<dependencyManagement> <dependencies> <dependency> <groupId> software.amazon.aw ssdk</groupId> <artifact Id>bom</artifactId> <version> *2.27.21*[2]</version> <type>pom</ type> <scope>im port</scope> </dependency> </dependencies> </dependencyManageme nt> <dependencies> <dependency> <groupId> software.amazon.aw ssdk</groupId> <artifact Id>iam-policy-buil der</artifactId> </dependency> </dependencies>

Change	v1	v2
Package name	`com.amazonaws.auth.policy`	`software.amazon.awssdk.policybuilder.iam`
Class names	Policy Statement • Statement.Effect • IdentiyManagementActions • Resource • Principal • Condition	IamPolicy IamStatement • IamEffect • IamAction • IamResource • IamPrincipal • IamCondition • IamConditionOperator • IamConditionKey

[1] Latest version. [2] Latest version.

API changes

Setting	v1	v2

Instantiate a policy	`Policy policy = new Policy();`	`IamPolicy.Builder policyBuilder = IamPolicy.builder();`
		`...`
		`IamPolicy policy = policyBuilder.build();`

Set id	`policy.withtId(...);` `policy.setId(...);`	`policyBuilder.id(...);`

Setting	v1	v2
Set version	N/A - uses default version of 2012-10-17	`policyBuilder.version(...);`
Create statement	`Statement statement = new Statement(Effect.Allow).withActions(...).withConditions(...).withId(...).withPrincipals(...).withResources(...);`	`IamStatement statement = IamStatement.builder().effect(IamEffect.ALLOW).actions(...).notActions(...).conditions(...).sid(...).principals(...).notPrincipals(...).resources(...).notResources(...).build()`
Set statement	`policy.withStatements(statement); policy.setStatements(statement);`	`policyBuilder.addStatement(statement);`

Differences in building a statement

Actions

v1

The v1 SDK has enum types for service actions that represent *Action* elements in a policy statement. The following enum types are some examples.

- IdentityManagementActions
- DynamoDBv2Actions
- SQSActions

The following example shows the SendMessage constant for SQSActions.

```
Action action = SQSActions.SendMessage;
```

You cannot specify a *NotAction* element to a statement in v1.

v2

In v2, the IamAction interface represents all actions. To specify a service-specific action element, pass a string to the `create` method as shown in the following code.

```
IamAction action = IamAction.create("sqs:SendMessage");
```

You can specify a *NotAction* for a statement with v2 as shown in the following code.

```
IamAction action = IamAction.create("sqs:SendMessage");
IamStatement.builder().addNotAction(action);
```

Conditions

v1

To represent statement conditions, the v1 SDK uses subclasses of Condition.

- ArnCondition

- BooleanCondition
- DateCondition
- IpAddressCondition
- NumericCondition
- StringCondition

Each `Condition` subclass defines a comparison `enum` type to help define the condition. For example, the following shows a *not like* string comparison for a condition.

```
Condition condition = new StringCondition(StringComparisonType.StringNotLike, "key",
 "value");
```

v2

In v2, you build a condition for a policy statement by using `IamCondition` and provide an `IamConditionOperator`, which contains `enums` for all types.

```
IamCondition condition = IamCondition.create(IamConditionOperator.STRING_NOT_LIKE,
 "key", "value");
```

Resources

v1

A policy statement's *`Resource`* element is represented by the SDK's `Resource` class. You supply the ARN as a string in the constructor. The following subclasses provide convenience constructors.

- S3BucketResource
- S3ObjectResource
- SQSQueueResource

In v1, you can specify a *`NotResource`* element for a `Resource` by calling the `withIsNotType` method as shown in the following statement.

```
Resource resource = new Resource("arn:aws:s3:::mybucket").withIsNotType(true);
```

v2

In v2, you create a *Resource* element by passing an ARN to the `IamResource.create` method.

```
IamResource resource = IamResource.create("arn:aws:s3:::mybucket");
```

An `IamResource` can be set as *NotResource* element as shown in the following snippet.

```
IamResource resource = IamResource.create("arn:aws:s3:::mybucket");
IamStatement.builder().addNotResource(resource);
```

`IamResource.ALL` represents all resources.

Principals

v1

The v1 SDK offers the following `Principal` classes to represent types of principals that include all members:

- `AllUsers`
- `AllServices`
- `AllWebProviders`
- `All`

You cannot add a *NotPrincipal* element to a statement.

v2

In v2, `IamPrincipal.ALL` represents all principals:

To represent all members in other types of principals, use the `IamPrincipalType` classes when you create a `IamPrincipal`.

- `IamPrincipal.create(IamPrincipalType.AWS,"*")` for all users.
- `IamPrincipal.create(IamPrincipalType.SERVICE,"*")` for all services.
- `IamPrincipal.create(IamPrincipalType.FEDERATED,"*")` for all web providers.
- `IamPrincipal.create(IamPrincipalType.CANONICAL_USER,"*")` for all canonical users.

You can use the `addNotPrincipal` method to represent a *NotPrincipal* element when you create a policy statement as shown in the following statement.

```
IamPrincipal principal = IamPrincipal.create(IamPrincipalType.AWS,
 "arn:aws:iam::444455556666:root");
IamStatement.builder().addNotPrincipal(principal);
```

Changes in the DynamoDB mapping/document APIs from version 1 to version 2

This topic details the changes in the Java SDK's high-level APIs for Amazon DynamoDB from version 1.x (v1) to the AWS SDK for Java 2.x (v2). We first cover the object-to-table mapping API and then discuss the document API for working with JSON-style documents.

High-level changes

Empty string handling difference

V1 and v2 handle empty strings differently when sending requests:

- **V1**: Sends empty strings as null values
- **V2**: Sends empty strings as empty string values

After you migrate to v2, DynamoDB receives different values for empty strings. To maintain consistent data with existing records, implement custom converters.

The names of the mapping client in each library differ in v1 and v2:

- v1 - DynamoDBMapper
- v2 - DynamoDB Enhanced Client

You interact with the two libraries in much the same way: you instantiate a mapper/client and then supply a Java POJO to APIs that read and write these items to DynamoDB tables. Both libraries also offer annotations for the class of the POJO to direct how the client handles the POJO.

Notable differences when you move to v2 include:

- V2 and v1 use different method names for the low-level DynamoDB operations. For example:

v1	v2
load	getItem
save	putItem
batchLoad	batchGetItem

- V2 offers multiple ways to define table schemas and map POJOs to tables. You can choose from the use of annotations or a schema generated from code using a builder. V2 also offers mutable and immutable versions of schemas.
- With v2, you specifically create the table schema as one of the first steps, whereas in v1, the table schema is inferred from the annotated class as needed.
- V2 includes the Document API client in the enhanced client API, whereas v1 uses a separate API.
- All APIs are available in synchronous and asynchronous versions in v2.

See the DynamoDB mapping section in this guide for more detailed information on the v2 enhanced client.

Import dependencies

v1

```
<dependencyManagement>
  <dependencies>
    <dependency>
      <groupId>com.amazonaws</gro
upId>
      <artifactId>aws-java-sdk-bom</
artifactId>
      <version> 1.X.X</version>
      <type>pom</type>
      <scope>import</scope>
    </dependency>
  </dependencies>
</dependencyManagement>
```

v2

```
<dependencyManagement>
  <dependencies>
    <dependency>
      <groupId>software.amazon.aw
ssdk</groupId>
      <artifactId>bom</artifactId>
      <version> 2.X.X*</version>
      <type>pom</type>
      <scope>import</scope>
    </dependency>
  </dependencies>
</dependencyManagement>

<dependencies>
```

v1	v2
<dependencies> <dependency> <groupId>com.amazonaws</groupId> <artifactId>aws-java-sdk-dynamodb</artifactId> </dependency> </dependencies>	<dependency> <groupId>software.amazon.awssdk</groupId> <artifactId>dynamodb-enhanced</artifactId> </dependency> </dependencies>

* Latest version.

In v1, a single dependency includes both the low-level DynamoDB API and the mapping/document API, whereas in v2, you use the `dynamodb-enhanced` artifact dependency to access the mapping/document API. The `dynamodb-enhanced` module contains a transitive dependency on the low-level `dynamodb` module.

API changes

Create a client

Use case	v1	v2
Normal instantiation	`AmazonDynamoDB standardClient = AmazonDynamoDBClientBuilder.standard()  .withCredentials(credentialsProvider)  .withRegion(Regions.US_EAST_1)  .build(); DynamoDBMapper mapper = new DynamoDBMapper(standardClient);`	`DynamoDbClient standardClient = DynamoDbClient.builder()  .credentialsProvider(ProfileCredentialsProvider.create())  .region(Region.US_EAST_1)  .build(); DynamoDbEnhancedClient enhancedClient = DynamoDbEnhancedClient.builder()  .dynamoDbClient(standardClient)  .build();`

Use case	v1	v2
Minimal instantiation	`AmazonDynamoDB standardClient = AmazonDynamoDBClientBuilder.standard(); DynamoDBMapper mapper = new DynamoDBMapper(standardClient);`	`DynamoDbEnhancedClient enhancedClient = DynamoDbEnhancedClient.create();`
With attribute transformer*	`DynamoDBMapper mapper = new DynamoDBMapper(standardClient, attributeTransformerInstance);`	`DynamoDbEnhancedClient enhancedClient = DynamoDbEnhancedClient.builder() .dynamoDbClient(standardClient) .extensions(extensionAInstance, extensionBInstance) .build();`

*Extensions in v2 correspond roughly to attribute transformers in v1. The the section called “Use extensions” section contains more information on extensions in v2.

Establish mapping to DynamoDB table/index

In v1, you specify a DynamoDB table name through a bean annotation. In v2, a factory method, `table()`, produces an instance of `DynamoDbTable` that represents the remote DynamoDB table. The first parameter of the `table()` method is the DynamoDB table name.

Use case	v1	v2
Map the Java POJO class to the DynamoDB table	`@DynamoDBTable(tableName ="Customer") public class Customer { ... }`	`DynamoDbTable<Customer> customerTable = enhancedClient.table("Customer", TableSchema.fromBean(Customer.class));`

Use case	v1	v2

Map to a DynamoDB secondary index	1. Define a POJO class that represents the index.
	• Annotate class with the `@DynamoDBTable` supplying the name of the table that has the index.
	• Annotate properties with `@DynamoDBIndexHashKey` and optionally `@DynamoDBIndexRangeKey` .
	2. Create a query expression.
	3. Query using reference to the POJO class that represents the index. For example
	`mapper.query(IdEmailIndex.class, queryExpression)`
	where `IdEmailIndex` is the mapping class for the index.
	
	The section in the DynamoDB Developer Guide that discusses the v1 query method shows a complete example.
		1. Annotate attributes of a POJO class with `@DynamoDbSecondaryPartitionKey` (for a GSI) and `@DynamoDbSecondarySortKey` (for and GSI or LSI). For example,
		`@DynamoDbSecondarySortKey(indexNames = "IdEmailIndex") public String getEmail() { return this.email; }`
		2. Retrieve a reference to the index. For example,
		`DynamoDbIndex<Customer> customerIndex = customerTable.index("IdEmailIndex");`
		3. Query the index.
		
		The ??? section in this guide provides more information.

Table operations

This section describes operation APIs that differ between v1 and v2 for most standard use cases.

In v2, all operations that involve a single table are called on the `DynamoDbTable` instance, not on the enhanced client. The enhanced client contains methods that can target multiple tables.

In the table named *Table operations* below, a POJO instance is referred to as `item` or as a specific type such as `customer1`. For the v2 examples the instances named, `table` is the result of previously calling `enhancedClient.table()` that returns a reference to the `DynamoDbTable` instance.

Note that most v2 operations can be called with a fluent consumer pattern even when not shown. For example,

```
Customer customer = table.getItem(r # r.key(key));
  or
Customer customer = table.getItem(r # r.key(k ->
 k.partitionValue("id").sortValue("email")))
```

For v1 operations, the table contains some of the commonly used forms and not all overloaded forms. For example, the `load()` method has the following overloads:

```
mapper.load(Customer.class, hashKey)
mapper.load(Customer.class, hashKey, rangeKey)
mapper.load(Customer.class, hashKey, config)
mapper.load(Customer.class, hashKey, rangeKey, config)
mapper.load(item)
mapper.load(item, config)
```

The table shows the commonly used forms:

```
mapper.load(item)
mapper.load(item, config)
```

Table operations

Use case	v1	Dynam operat	v2

Write a Java POJO to a Dynam table	`mapper.save(item)`
	`mapper.save(item, config)`
	`mapper.save(item, saveExpression, config)`
	
	In v1, `DynamoDBMapperConfig.SaveBehavior` and annotations determines which low-level DynamoDB method will be called. In general, `UpdateItem` is called except when using `SaveBehavior.CLOBBER` and `SaveBehavior.PUT`. Auto-generated keys are a special use case, and occasionally both `PutItem` and `UpdateItem` are used.
		PutIt Update m	`table.putItem(putItemRequest)`
			`table.putItem(item)`
			`table.putItemWithResponse(item) // Returns metadata.`
			
			`updateItem(updateItemRequest)`
			`table.updateItem(item)`
			`table.updateItemWithResponse(item) //Returns metadata.`

Read an item from a Dynam table to a Java POJO	`mapper.load(item)`
	`mapper.load(item, config)`
		GetIt	`table.getItem(getItemRequest)`
			`table.getItem(item)`
			`table.getItem(key)`
			`table.getItemWithResponse(key) // Returns POJO with metadata.`

Use case	v1	Dynam operat	v2

Delete an item from a Dynam table	`mapper.delete(item , deleteExpression, config)`	`Delet m`	`table.deleteItem(deleteItemRequest)`
			`table.deleteItem(item)`
			`table.deleteItem(key)`

Query a Dynam table or seconc index and return a pagina list	`mapper.query(Custo mer.class, queryExpr ession)`
	`mapper.query(Custom er.class, queryExpr ession, mapperConfig)`
		`Query`	`table.query(queryRequest)`
			`table.query(queryConditional)`
			
			Use the returned `PageIterable.strea m()` (lazy loading) for sync responses and `PagePublisher.subscribe()` for async responses

Query a Dynam table or seconc index and return a list	`mapper.queryPage(C ustomer.class, queryExpr ession)`
	`mapper.queryPage(Cu stomer.class, queryExpr ession, mapperConfig)`
		`Query`	`table.query(queryRequest)`
			`table.query(queryConditional)`
			
			Use the returned `PageIterable.items ()` (lazy loading) for sync responses and `PagePublisher.items.subscribe()` for async responses

Use case	v1	Dynam operat	v2

Scan a Dynam table or seconc index and return a pagina list	`mapper.scan(Custom er.class, scanExpre ssion)`
	`mapper.scan(Customer .class, scanExpression, mapperConfig)`
		Scan	`table.scan()`
			`table.scan(scanRequest)`
			
			Use the returned `PageIterable.strea m()` (lazy loading) for sync responses and `PagePublisher.subscribe()` for async responses

Scan a Dynam table or seconc index and return a list	`mapper.scanPage(Cu stomer.class, scanExpre ssion)`
	`mapper.scanPage(Cust omer.class, scanExpre ssion, mapperConfig)`
		Scan	`table.scan()`
			`table.scan(scanRequest)`
			
			Use the returned `PageIterable.items ()` (lazy loading) for sync responses and `PagePublisher.items.subscribe()` for async responses

Use case	v1	Dynam operat	v2
Read multip items from multip tables in a batch	`mapper.batchLoad(A rrays.asList(customer1, customer2, book1)) mapper.batchLoad(it emsToGet) // itemsToGet: Map<Class<?>, List<KeyP air>>`	Batch tem	`enhancedClient.batchGetItem (batchGetItemRequest)` `enhancedClient.batchGetItem(r -> r.readBatches(ReadBatch.builder(Record1.c lass) .mappedTableResour ce(mappedTable1) .addGetItem(i -> i.key(k -> k.partitionValue(0))) .build(), ReadBatch.builder(Record2.c lass) .mappedTableResour ce(mappedTable2) .addGetItem(i -> i.key(k -> k.partitionValue(0))) .build()))`  `// Iterate over pages with lazy loading or over all items from the same table.`

Use case	v1	Dynam operat	v2

Write multip items to multip tables in a batch	`mapper.batchSave(A rrays.asList(customer1, customer2, book1))`	Batch eItem	`enhancedClient.batchWriteIt em(batchWriteItemRequest)`
			
			`enhancedClient.batchWriteItem(r -> r.writeBatches( WriteBatch.builder(Record1. class) .mappedTableResour ce(mappedTable1) .addPutItem(item1) .build(), WriteBatch.builder(Record2. class) .mappedTableResour ce(mappedTable2) .addPutItem(item2) .build()))`

Delete multip items from multip tables in a batch	`mapper.batchDelete (Arrays.asList(cus tomer1, customer2, book1))`	Batch eItem	`enhancedClient.batchWriteItem(r -> r.writeBatches( WriteBatch.builder(Record1. class) .mappedTableResour ce(mappedTable1) .addDeleteItem(ite m1key) .build(), WriteBatch.builder(Record2. class) .mappedTableResour ce(mappedTable2) .addDeleteItem(ite m2key) .build()))`

Use case	v1	Dynam operat	v2
Write/delete multip items in a batch	`mapper.batchWrite( Arrays.asList(cust omer1, book1), Arrays.as List(customer2))`	BatchW eItem	`enhancedClient.batchWriteItem(r -> r.writeBatches( WriteBatch.builder(Record1. class) .mappedTableResour ce(mappedTable1) .addPutItem(item1) .build(), WriteBatch.builder(Record2. class) .mappedTableResour ce(mappedTable2) .addDeleteItem(ite m2key) .build()))`
Carry out a transa onal write	`mapper.transaction Write(transactionW riteRequest)`	Trans riteI	`enhancedClient.transactWrit eItems(transasctWriteItemsRequest)`
Carry out a transa onal read	`mapper.transaction Load(transactionLo adRequest)`	Trans etIte	`enhancedClient.transactGetI tems(transactGetItemsRequest)`

Use case	v1	Dynam operat	v2
Get count of matchi items of a scan or query	`mapper.count(Custo mer.class, queryExpr ession)` `mapper.count(Custom er.class, scanExpre ssion)`	Query, Scan with Selec UNT	Not supported

Create a table in Dynam corresp ding to the POJO class	`mapper.generateCre ateTableRequest(Cu stomer.class)`
	The previous statement generates a low-level create table request; users must call `createTable` on the DynamoDB client.
		Create le	`table.createTable(createTab leRequest)`
			`table.createTable(r -> r.provisi onedThroughput(getDefaultPr ovisionedThroughput())`
			`.globalSecondaryIndices(`
			`EnhancedGlobalSeco ndaryIndex.builder()`
			`.indexNam e("gsi_1")`
			`.projection(p -> p.projectionType(Projection Type.ALL))`
			`.provisio nedThroughput(getDefaultPro visionedThroughput())`
			`.build()));`

Use case	v1	Dynam operat	v2
Perfor a paralle scan in Dynam	`mapper.parallelScan(Customer.class, scanExpression, numTotalSegments)`	Scan with Segme and Total ents parame s	Users are required to handle the worker threads and call `scan` for each segment: `table.scan(r -> r.segment(0).totalSegments(5))`
Integra Amazo S3 with Dynam to store intellig nt S3 links	`mapper.createS3Link(bucket, key)` `mapper.getS3ClientCache()`	-	Not supported because it couples Amazon S3 and DynamoDB.

Map classes and properties

In both v1 and v2, you map classes to tables using bean-style annotations. V2 also offers other ways to define schemas for specific use cases, such as working with immutable classes.

Bean annotations

The following table shows the equivalent bean annotations for a specific use case that are used in v1 and v2. A `Customer` class scenario is used to illustrate parameters.

Annotations—as well as classes and enumerations—in v2 follow camel case convention and use 'DynamoDb', not 'DynamoDB'.

Use case	v1	v2
Map class to table	`@DynamoDBTable (tableName ="CustomerTable")`	`@DynamoDbBean` `@DynamoDbBean(converterProviders = {...})` The table name is defined when calling the `DynamoDbEnhancedClient#table()` method.
Designate a class member as a table attribute	`@DynamoDBAttribute (attributeName = "customerName")`	`@DynamoDbAttribute("customerName")`
Designate a class member is a hash/partition key	`@DynamoDBHashKey`	`@DynamoDbPartitionKey`
Designate a class member is a range/sort key	`@DynamoDBRangeKey`	`@DynamoDbSortKey`
Designate a class member is a secondary index hash/partition key	`@DynamoDBIndexHashKey`	`@DynamoDbSecondaryPartitionKey`

Use case	v1	v2
Designate a class member is a secondary index range/sort key	`@DynamoDBIndexRangeKey`	`@DynamoDbSecondarySortKey`
Ignore this class member when mapping to a table	`@DynamoDBIgnore`	`@DynamoDbIgnore`
Designate a class member as an auto-generated UUID key attribute	`@DynamoDBAutoGeneratedKey`	`@DynamoDbAutoGeneratedUuid` The extension that provides this is not loaded by default; you must add the extension to client builder.
Designate a class member as an auto-generated timestamp attribute	`@DynamoDBAutoGeneratedTimestamp`	`@DynamoDbAutoGeneratedTimestampAttribute` The extension that provides this is not loaded by default; you must add the extension to client builder.

Use case	v1	v2
Designate a class member as an auto-incremented version attribute	`@DynamoDBVersionAttribute`	`@DynamoDbVersionAttribute` The extension that provides this is auto-loaded.
Designate a class member as requiring a custom conversion	`@DynamoDBTypeConverted`	`@DynamoDbConvertedBy`
Designate a class member to be stored as a different attribute type	`@DynamoDBTyped(<DynamoDBAttributeType>)`	No equivalent
Designate a class that can be serialized to a DynamoDB document (JSON-style document) or sub-document	`@DynamoDBDocument`	No direct equivalent annotation. Use the Enhanced Document API.

V2 additional annotations

Use case	v1	v2
Designate a class member not to be stored as a NULL attribute if the Java value is null	N/A	`@DynamoDbIgnoreNulls`
Designate a class member to be an empty object if all attributes are null	N/A	`@DynamoDbPreserveEmptyObject`
Designate special update action for a class member	N/A	`@DynamoDbUpdateBehavior`
Designate an immutable class	N/A	`@DynamoDbImmutable`
Designate a class member as an auto-incremented counter attribute	N/A	`@DynamoDbAtomicCounter` The extension that provides this functionality is auto-loaded.

Configuration

In v1, you generally control specific behaviors by using an instance of `DynamoDBMapperConfig`. You can supply the configuration object either when you create the mapper or when you make a request. In v2, configuration is specific to the request object for the operation.

Use case	v1	Default in v1	v2
	`DynamoDBMapperConfig.builder()`		

Use case	v1	Default in v1	v2
Batch load retry strategy	`.withBatchLoadRetryStrategy(batchLoadRetryStrategy)`	retry failed items	
Batch write retry strategy	`.withBatchWriteRetryStrategy(batchWriteRetryStrategy)`	retry failed items	
Consistent reads	`.withConsistentReads(CONSISTENT)`	EVENTU	By default, consistent reads is false for read operations. Override with `.consistentRead(true)` on the request object.
Conversion schema with sets of marshallers/ unmarshallers	`.withConversionSchema(conversionSchema)` Static implementations provide backwards compatibility with older versions.	V2_COMPATIBLE	Not applicable. This is a legacy feature that refers to how the earliest versions of DynamoDB (v1) stored data types, and this behavior will not be preserved in the enhanced client. An example of behavior in DynamoDB v1 is storing booleans as Number instead of as Boolean.

Use case	v1	Default in v1	v2
Table names	`.withObjectTableNameResolver()` `.withTableNameOverride()` `.withTableNameResolver()` Static implementations provide backwards compatibility with older versions	use annotation or guess from class	The table name is defined when calling the `DynamoDbEnhancedClient#table()` method.
Pagination load strategy	`.withPaginationLoadingStrategy(strategy)` Options are: `LAZY_LOADING`, `EAGER_LOADING` , or `ITERATION_ONLY`	`LAZY_LOADING`	Iteration only is the default. The other v1 options are not supported.
Request metric collection	`.withRequestMetricCollector(collector)`	`null`	Use `metricPublisher()` in `ClientOverrideConfiguration` when building the standard DynamoDB client.

Use case	v1	Default in v1	v2
Save behavior	`.withSaveBehavior(SaveBehavior.CLOBBER)` Options are UPDATE, CLOBBER, PUT, APPEND_SET , or UPDATE_SKIP_NULL_ATTRIBUTES .	UPDATE	In v2, you call `putItem()` or `updateItem()` explicitly. CLOBBER or PUT: Corresponding action in v2 is calling `putItem()` . There is no specific CLOBBER configuration. UPDATE: Corresponds to `updateItem()` UPDATE_SKIP_NULL_ATTRIBUTES : Corresponds to `updateItem()` . Control update behavior with the request setting `ignoreNulls` and the annotation/tag `DynamoDbUpdateBehavior` . APPEND_SET : Not supported
Type converter factory	`.withTypeConverterFactory(typeConverterFactory)`	standard type converters	Set on the bean by using `@DynamoDbBean(converterProviders = {ConverterProvider.class, DefaultAttributeConverterProvider.class})`

Per-operation configuration

In v1, some operations, such as `query()`, are highly configurable through an “expression” object submitted to the operation. For example:

```
DynamoDBQueryExpression<Customer> emailBwQueryExpr = new
 DynamoDBQueryExpression<Customer>()
    .withRangeKeyCondition("Email",
        new Condition()
            .withComparisonOperator(ComparisonOperator.BEGINS_WITH)
            .withAttributeValueList(
                new AttributeValue().withS("my")));
```

```
mapper.query(Customer.class, emailBwQueryExpr);
```

In v2, instead of using a configuration object, you set parameters on the request object by using a builder. For example:

```
QueryEnhancedRequest emailBw = QueryEnhancedRequest.builder()
    .queryConditional(QueryConditional
        .sortBeginsWith(kb -> kb
            .sortValue("my"))).build();

customerTable.query(emailBw);
```

Conditionals

In v2, conditional and filtering expressions are expressed using an `Expression` object, which encapsulates the condition and the mapping of names and filters.

Use case	Operations	v1	v2
Expected attribute conditions	save(), delete(), query(), scan()	`new DynamoDBSaveExpression()  .withExpected(Collections.singletonMap(  "otherAttribute", new ExpectedAttributeValue(false)))  .withConditionalOperator(ConditionalOperator.AND);`	Deprecated; use `ConditionExpression` instead.
Condition expression	delete()	`deleteExpression.setConditionExpression("zipcode = :zipcode")`	`Expression conditionExpression =  Expression.builder()  .expression("#key = :value OR #key1 = :value1")  .putExpressionName("#key", "attribute")`

Use case	Operations	v1	v2
		deleteExpression .setExpressionAttr ibuteValues(...)	.putExpressionName ("#key1", "attribute3") .putExpressionValu e(":value", AttributeValues.st ringValue("wrong")) .putExpressionValu e(":value1", AttributeValues.st ringValue("three")) .build(); DeleteItemEnhancedRequest request = DeleteItemEnhancedRequest.b uilder() .conditionExpressi on(conditionExpression).build();

Filter expressio
n
	query(),
	scan()
		scanExpression
		.withFilterExpress
		ion("#statename
		= :state")
		.withExpressionAtt
		ributeValues(attri
		buteValueMapBuilde
		r.build())
		.withExpressionAtt
		ributeNames(attrib
		uteNameMapBuilder.
		build())
			Map<String, AttributeValue> values
			= singletonMap(":key", stringVal
			ue("value"));
			Expression filterExpression =
			Expression.builder()
			.expression("name = :key")
			.expressionValues(values)
			.build();
			QueryEnhancedRequest request =
			QueryEnhancedRequest.builder()
			.filterExpression(filterExp
			ression).build();

Use case	Operations	v1	v2

Condition expression for query	query()	`queryExpression.withKeyConditionExpression()`	`QueryConditional keyEqual = QueryConditional.keyEqualTo(b -> b .partitionValue("movie01"));`
			
			`QueryEnhancedRequest tableQuery = QueryEnhancedRequest.builder() .queryConditional(keyEqual) .build();`

Type conversion

Default converters

In v2, the SDK provides a set of default converters for all common types. You can change type converters both at the overall provider level as well as for a single attribute. You can find a list of the available converters in the AttributeConverter API reference.

Set a custom converter for an attribute

In v1, you can annotate a getter method with `@DynamoDBTypeConverted` to specify the class that converts between the Java attribute type and a DynamoDB attribute type. For instance, a `CurrencyFormatConverter` that converts between a Java `Currency` type and DynamoDB String can be applied as shown in the following snippet.

```
@DynamoDBTypeConverted(converter = CurrencyFormatConverter.class)
public Currency getCurrency() { return currency; }
```

The v2 equivalent of the previous snippet is shown below.

```
@DynamoDbConvertedBy(CurrencyFormatConverter.class)
public Currency getCurrency() { return currency; }
```

> **Note**
>
> In v1, you can apply the annotation to the attribute itself , a type or a user-defined annotation, v2 supports applying the annotation it only to the getter.

Add a type converter factory or provider

In v1, you can provide your own set of type converters, or override the types you care about by adding a type converter factory to the configuration. The type converter factory extends `DynamoDBTypeConverterFactory`, and overrides are done by getting a reference to the default set and extending it. The following snippet demonstrates how to do this.

```
DynamoDBTypeConverterFactory typeConverterFactory =
    DynamoDBTypeConverterFactory.standard().override()
        .with(String.class, CustomBoolean.class, new DynamoDBTypeConverter<String,
 CustomBoolean>() {
            @Override
            public String convert(CustomBoolean bool) {
                return String.valueOf(bool.getValue());
            }
            @Override
            public CustomBoolean unconvert(String string) {
                return new CustomBoolean(Boolean.valueOf(string));
            }}).build();
DynamoDBMapperConfig config =
    DynamoDBMapperConfig.builder()
        .withTypeConverterFactory(typeConverterFactory)
        .build();
DynamoDBMapper mapperWithTypeConverterFactory = new DynamoDBMapper(dynamo, config);
```

V2 provides similar functionality through the `@DynamoDbBean` annotation. You can provide a single `AttributeConverterProvider` or a chain of ordered `AttributeConverterProviders`. Note that if you supply your own chain of attribute converter providers, you will override the default converter provider and must include it in the chain to use its attribute converters.

```
@DynamoDbBean(converterProviders = {
   ConverterProvider1.class,
   ConverterProvider2.class,
   DefaultAttributeConverterProvider.class})
```

```
public class Customer {
  ...
}
```

The section on attribute conversion in this guide contains a complete example for v2.

Document API

The Document API supports working with JSON-style documents as single items in a DynamoDB table. The v1 Document API has a corresponding API in v2, but instead of using a separate client for the document API as in v1, v2 incorporates document API features in the DynamoDB enhanced client.

In v1, the `Item` class represents an unstructured record from a DynamoDB table. In v2, an unstructured record is represented by an instance of the `EnhancedDocument` class. Note that primary keys are defined in the table schema for v2, and on the item itself in v1.

The table below compares the differences between the Document APIs in v1 and v2.

Use case	v1	v2
Create a document client	`AmazonDynamoDB client = ... //Create a client. DynamoDB documentClient = new DynamoDB(client);`	`// The v2 Document API uses the same DynamoDbEnhancedClient // that is used for mapping POJOs. DynamoDbClient standardClient = ... //Create a standard client. DynamoDbEnhancedClient enhancedClient = ... // Create an enhanced client.`
Reference a table	`Table documentTable = docClient.documentClient("Person");`	`DynamoDbTable<EnhancedDocument> documentTable = enhancedClient.table("Person",`

Use case	v1	v2
		TableSchema.documentSchemaBuilder() .addIndexPartitionKey(TableMetadata.primaryIndexName(),"id", AttributeValueType.S) .attributeConverterProviders(AttributeConverterProvider.defaultProvider()) .build()); ;
Work with semi-structured data		
Put item	Item item = new Item() .withPrimaryKey("id", 50) .withString("firstName", "Shirley"); PutItemOutcome outcome = documentTable.putItem(item);	EnhancedDocument personDocument = EnhancedDocument.builder() .putNumber("id", 50) .putString("firstName", "Shirley") .build(); documentTable.putItem(personDocument);

Use case	v1	v2
Get item	`GetItemOutcome outcome = documentTable.getItemOutcome( "id", 50); Item personDocFromDb = outcome.getItem(); String firstName = personDocFromDb.getString("firstName");`	`EnhancedDocument personDocFromDb = documentTable .getItem( Key.builder() .partitionValue(50) .build()); String firstName = personDocFromDb.getString("firstName");`
Work with JSON items		
Convert a JSON structure to use it with the Document API	`// The 'jsonPerson' identifier is a JSON string. Item item = new Item().fromJSON(jsonPerson);`	`// The 'jsonPerson' identifier is a JSON string. EnhancedDocument document = EnhancedDocument.builder() .json(jsonPerson).build());`
Put JSON	`documentTable.putItem(item)`	`documentTable.putItem(document);`
Read JSON	`GetItemOutcome outcome = //Get item. String jsonPerson = outcome.getItem().toJSON();`	`String jsonPerson = documentTable.getItem(Key.builder() .partitionValue(50).build()) .fromJson();`

FAQ

Q. Does optimistic locking with a version number work the same way in v2 as in v1?

A. The behavior is similar, but v2 does not does not automatically add conditions for the delete operations. You must add condition expressions manually if you want to control the delete behavior.

Changes in automatic Amazon SQS request batching from version 1 to version 2

This topic details the changes in automatic request batching for Amazon SQS between version 1 and version 2 of the AWS SDK for Java.

High-level changes

The AWS SDK for Java 1.x performs client-side buffering using a separate `AmazonSQSBufferedAsyncClient` class that requires explicit initialization for request batching.

The AWS SDK for Java 2.x simplifies and enhances buffering functionality with the `SqsAsyncBatchManager`. The implementation of this interface provides automatic request batching capabilities directly integrated with the standard `SqsAsyncClient`. To learn about v2's `SqsAsyncBatchManager`, see the the section called “Use automatic request batching” topic in this guide.

Change	v1	v2
Maven dependencies	<dependencyManagement> <dependencies> <dependency> <groupId> com.amazonaws</gro upId> <artifact Id>aws-java-sdk-bom</ artifactId> <version> *1.12.782*[1]</version> <type>pom</ type> <scope>im port</scope> </dependency> </dependencies> </dependencyManageme nt> <dependencies> <dependency> <groupId> com.amazonaws</gro upId> <artifact Id>aws-java-sdk-sqs</ artifactId> </dependency> </dependencies>	<dependencyManagement> <dependencies> <dependency> <groupId> software.amazon.aw ssdk</groupId> <artifact Id>bom</artifactId> <version> *2.31.15*[2]</version> <type>pom</ type> <scope>im port</scope> </dependency> </dependencies> </dependencyManageme nt> <dependencies> <dependency> <groupId> software.amazon.aw ssdk</groupId> <artifact Id>sqs</artifactId> </dependency> </dependencies>
Package names	`com.amazonaws.serv ices.sqs.buffered`	`software.amazon.aw ssdk.services.sqs. batchmanager`
Class names	`AmazonSQSBufferedA syncClient`	`SqsAsyncBatchManager`

[1] Latest version. [2] Latest version.

Using automatic SQS request batching

Change	v1	v2
Create a batch manager	`AmazonSQSAsync sqsAsync = new AmazonSQSAsyncClient(); AmazonSQSAsync bufferedSqs = new AmazonSQSBufferedAsyncClient(sqsAsync);`	`SqsAsyncClient asyncClient = SqsAsyncClient.create(); SqsAsyncBatchManager sqsAsyncBatchManager = asyncClient.batchManager();`

Create a batch manager with custom configuration	`AmazonSQSAsync sqsAsync = new AmazonSQSAsyncClient();`
	
	`QueueBufferConfig queueBufferConfig = new QueueBufferConfig()`
	`.withMaxBatchOpenMs(200)`
	`.withMaxBatchSize(10)`
	`.withMinReceiveWaitTimeMs(1000)`
	`.withVisibilityTimeoutSeconds(20)`
	`.withReceiveMessageAttributeNames(messageAttributeValues);`
	
	`AmazonSQSAsync bufferedSqs =`
	`new AmazonSQSBufferedAsyncClien`
		`BatchOverrideConfiguration batchOverrideConfiguration = BatchOverrideConfiguration.builder()`
		`.sendRequestFrequency(Duration.ofMillis(200))`
		`.maxBatchSize(10)`
		`.receiveMessageMinWaitDuration(Duration.ofMillis(1000))`
		`.receiveMessageVisibilityTimeout(Duration.ofSeconds(20))`
		`.receiveMessageSystemAttributeNames(messageSystemAttributeNames)`
		`.receiveMessageAttributeNames(messageAttributeValues)`
		`.build();`

Change	v1	v2
	`t(sqsAsync, queueBuff erConfig);`	`SqsAsyncBatchManager sqsAsyncBatchManager = SqsAsyncBatchManag er.builder() .override Configuration(batc hOverrideConfigura tion) .client(S qsAsyncClient.crea te()) .schedule dExecutor(Executor s.newScheduledThre adPool(8)) .build();`
Send messages	`Future<SendMessage Result> sendResul tFuture = bufferedS qs.sendMessageAsyn c(new SendMessa geRequest() .withQueueUrl(queu eUrl) .withMessageBody(b ody));`	`CompletableFuture< SendMessageResponse> sendCompletableFuture = sqsAsyncB atchManager.sendMe ssage( SendMessageRequest .builder() .queueUrl(queueUrl) .messageBody(body) .build());`

Change	v1	v2
Delete messages	`Future<DeleteMessageResult> deletResultFuture = bufferedSqs.deleteMessageAsync(new DeleteMessageRequest() .withQueueUrl(queueUrl));`	`CompletableFuture<DeleteMessageResponse> deleteResultCompletableFuture = sqsAsyncBatchManager.deleteMessage( DeleteMessageRequest.builder() .queueUrl(queueUrl) .build());`
Change visibility of messages	`Future<ChangeMessageVisibilityResult> changeVisibilityResultFuture = bufferedSqs.changeMessageVisibilityAsync (new ChangeMessageVisibilityRequest() .withQueueUrl(queueUrl) .withVisibilityTimeout(20));`	`CompletableFuture<ChangeMessageVisibilityResponse> changeResponseCompletableFuture = sqsAsyncBatchManager.changeMessageVisibility( ChangeMessageVisibilityRequest.builder() .queueUrl(queueUrl) .visibilityTimeout(20) .build());`

Change	v1	v2
Receive messages	`ReceiveMessageResult receiveResult = bufferedSqs.receiveMessage( new ReceiveMessageRequest() .withQueueUrl(queueUrl));`	`CompletableFuture<ReceiveMessageResponse> responseCompletableFuture = sqsAsyncBatchManager.receiveMessage( ReceiveMessageRequest.builder() .queueUrl(queueUrl) .build());`

Asynchronous return type differences

Change	v1	v2
Return type	`Future<ResultType>`	`CompletableFuture<ResponseType>`
Callback mechanism	Requires an `AsyncHandler` with separate `onSuccess` and `onError` methods	Uses `CompletableFuture` APIs provided by the JDK, such as `whenComplete()` , `thenCompose()` , `thenApply()`
Exception handling	Uses `AsyncHandler#onError()` method	Uses `CompletableFuture` APIs provided by the JDK, such as `exceptionally()` , `handle()`, or `whenComplete()`
Cancellation	Basic support through `Future.cancel()`	Cancelling a parent `CompletableFuture`

Change	v1	v2
		automatically cancels all dependent futures in the chain

Asynchronous completion handling differences

Change	v1	v2
Response handler implement ation	`Future<ReceiveMess ageResult> future = bufferedSqs.receiv eMessageAsync(receiveRequest, new AsyncHand ler<ReceiveMessage Request, ReceiveMe ssageResult>() { @Override public void onSuccess(ReceiveM essageRequest request, ReceiveMe ssageResult result) { List<Message> messages = result.getMessages (); System.out.println ("Received " + messages.size() + " messages"); for (Message message : messages) { System.out.println`	`CompletableFuture< ReceiveMessageResp onse> completab leFuture = sqsAsyncB atchManager .receiveM essage(ReceiveMess ageRequest.builder() .queueUrl (queueUrl).build()) .whenComp lete((receiveMessa geResponse, throwable) -> { if (throwabl e != null) { System.err.println ("Error receiving messages: " + throwable .getMessage()); throwable.printSta ckTrace(); } else { List<Message> messages = receiveMessageResp onse.messages(); System.out.println`

Change	v1	v2

	("Message ID: " + message.getMessage Id());
	
	System.out.println ("Body: " + message.g etBody());
	}
	}
	
	@Override
	public void onError(Exception e) {
	
	System.err.println ("Error receiving messages: " + e.getMess age());
	
	e.printStackTrace();
	}
	}
	);
		("Received " + messages.size() + " messages");
		for (Message message : messages) {
		
		System.out.println ("Message ID: " + message.messageId());
		
		System.out.println ("Body: " + message.b ody());
		}
		}
		});

Key configuration parameters

Parameter	v1	v2
Maximum batch size	`maxBatchSize` (default 10 requests per batch)	`maxBatchSize` (default 10 requests per batch)
Batch wait time	`maxBatchOpenMs` (default 200 ms)	`sendRequestFrequency` (default 200 ms)
Visibility timeout	`visibilityTimeoutS econds` (-1 for queue default)	`receiveMessageVisi bilityTimeout` (queue default)

Parameter	v1	v2
Minimum wait time	`longPollWaitTimeoutSeconds` (20s when `longPoll` is true)	`receiveMessageMinWaitDuration` (default 50 ms)
Message attributes	Set using `ReceiveMessageRequest`	`receiveMessageAttributeNames` (none by default)
System attributes	Set using `ReceiveMessageRequest`	`receiveMessageSystemAttributeNames` (none by default)
Long polling	`longPoll` (default is true)	Not supported to avoid open connections waiting until the server sends the messages
Maximum wait time for long polling	`longPollWaitTimeoutSeconds` (default 20s)	Not supported to avoid open connections waiting until the server sends the messages
Maximum number of prefetched receive batches stored client-side	`maxDoneReceiveBatches` (10 batches)	Not supported because it is handled internally
Maximum number of active outbound batches processed simultaneously	`maxInflightOutboundBatches` (default 5 batches)	Not supported because it is handled internally
Maximum number of active receive batches processed simultaneously	`maxInflightReceiveBatches` (default 10 batches)	Not supported because it is handled internally

Use the SDK for Java 1.x and 2.x side-by-side

You can use both versions of the AWS SDK for Java in your projects.

The following shows an example of the `pom.xml` file for a project that uses Amazon S3 from version 1.x and DynamoDB from version 2.27.21.

Example Example of POM

This example shows a `pom.xml` file entry for a project that uses both 1.x and 2.x versions of the SDK.

```
<dependencyManagement>
    <dependencies>
        <dependency>
            <groupId>com.amazonaws</groupId>
            <artifactId>aws-java-sdk-bom</artifactId>
            <version>1.12.1</version>
            <type>pom</type>
            <scope>import</scope>
        </dependency>
        <dependency>
          <groupId>software.amazon.awssdk</groupId>
          <artifactId>bom</artifactId>
          <version>2.27.21</version>
          <type>pom</type>
          <scope>import</scope>
        </dependency>
    </dependencies>
</dependencyManagement>

<dependencies>
    <dependency>
      <groupId>com.amazonaws</groupId>
      <artifactId>aws-java-sdk-s3</artifactId>
    </dependency>
    <dependency>
      <groupId>software.amazon.awssdk</groupId>
      <artifactId>dynamodb</artifactId>
    </dependency>
</dependencies>
```

Security for the AWS SDK for Java

Cloud security at Amazon Web Services (AWS) is the highest priority. As an AWS customer, you benefit from a data center and network architecture that is built to meet the requirements of the most security-sensitive organizations. Security is a shared responsibility between AWS and you. The Shared Responsibility Model describes this as Security of the Cloud and Security in the Cloud.

Security of the Cloud – AWS is responsible for protecting the infrastructure that runs all of the services offered in the AWS Cloud and providing you with services that you can use securely. Our security responsibility is the highest priority at AWS, and the effectiveness of our security is regularly tested and verified by third-party auditors as part of the AWS Compliance Programs.

Security in the Cloud – Your responsibility is determined by the AWS service you are using, and other factors including the sensitivity of your data, your organization's requirements, and applicable laws and regulations.

This AWS product or service follows the shared responsibility model through the specific Amazon Web Services (AWS) services it supports. For AWS service security information, see the AWS service security documentation page and AWS services that are in scope of AWS compliance efforts by compliance program.

Data protection in AWS SDK for Java 2.x

The AWS shared responsibility model applies to data protection in AWS SDK for Java. As described in this model, AWS is responsible for protecting the global infrastructure that runs all of the AWS Cloud. You are responsible for maintaining control over your content that is hosted on this infrastructure. You are also responsible for the security configuration and management tasks for

the AWS services that you use. For more information about data privacy, see the Data Privacy FAQ. For information about data protection in Europe, see the AWS Shared Responsibility Model and GDPR blog post on the *AWS Security Blog*.

For data protection purposes, we recommend that you protect AWS account credentials and set up individual users with AWS IAM Identity Center or AWS Identity and Access Management (IAM). That way, each user is given only the permissions necessary to fulfill their job duties. We also recommend that you secure your data in the following ways:

- Use multi-factor authentication (MFA) with each account.
- Use SSL/TLS to communicate with AWS resources. We require TLS 1.2 and recommend TLS 1.3.
- Set up API and user activity logging with AWS CloudTrail. For information about using CloudTrail trails to capture AWS activities, see Working with CloudTrail trails in the *AWS CloudTrail User Guide*.
- Use AWS encryption solutions, along with all default security controls within AWS services.
- Use advanced managed security services such as Amazon Macie, which assists in discovering and securing sensitive data that is stored in Amazon S3.
- If you require FIPS 140-3 validated cryptographic modules when accessing AWS through a command line interface or an API, use a FIPS endpoint. For more information about the available FIPS endpoints, see Federal Information Processing Standard (FIPS) 140-3.

We strongly recommend that you never put confidential or sensitive information, such as your customers' email addresses, into tags or free-form text fields such as a **Name** field. This includes when you work with SDK for Java or other AWS services using the console, API, AWS CLI, or AWS SDKs. Any data that you enter into tags or free-form text fields used for names may be used for billing or diagnostic logs. If you provide a URL to an external server, we strongly recommend that you do not include credentials information in the URL to validate your request to that server.

Working with TLS in the SDK for Java

The AWS SDK for Java uses the TLS capabilities of its underlying Java platform. In this topic, we show examples using the OpenJDK implementation used by Amazon Corretto 17.

To work with AWS services, the underlying JDK must support a minimum version of TLS 1.2, but TLS 1.3 is recommended.

Users should consult the documentation of the the Java platform they are using with the SDK to find out which TLS versions are enabled by default as well as how to enable and disable specific TLS versions.

How to check TLS version information

Using OpenJDK, the following code shows the use of SSLContext to print which TLS/SSL versions are supported.

```
System.out.println(Arrays.toString(SSLContext.getDefault().getSupportedSSLParameters().getProto
```

For example, Amazon Corretto 17 (OpenJDK) produces the following output.

```
[TLSv1.3, TLSv1.2, TLSv1.1, TLSv1, SSLv3, SSLv2Hello]
```

To see the SSL handshake in action and what version of TLS is used, you can use the system property **javax.net.debug**.

For example, run a Java applications that uses TLS.

```
java app.jar -Djavax.net.debug=ssl:handshake
```

The application logs the SSL handshake similar to the following.

```
...
javax.net.ssl|DEBUG|10|main|2022-12-23 13:53:12.221 EST|ClientHello.java:641|Produced
 ClientHello handshake message (
"ClientHello": {
  "client version"      : "TLSv1.2",

...
javax.net.ssl|DEBUG|10|main|2022-12-23 13:53:12.295 EST|ServerHello.java:888|Consuming
 ServerHello handshake message (
"ServerHello": {
  "server version"      : "TLSv1.2",
...
```

Enforce a minimum TLS version

The SDK for Java always prefers the latest TLS version supported by the platform and service. If you wish to enforce a specific minimum TLS version, consult your Java platform's documentation.

For OpenJDK-based JVMs, you can use the system property `jdk.tls.client.protocols`.

For example, if you want SDK service clients in your application to use TLS 1.2, even though TLS 1.3 is available, provide the following system property.

```
java app.jar -Djdk.tls.client.protocols=TLSv1.2
```

AWS API endpoints upgrade to TLS 1.2

See this blog post for information about AWS API endpoints moving to TLS 1.2 for the minimum version.

Identity and Access Management

AWS Identity and Access Management (IAM) is an AWS service that helps an administrator securely control access to AWS resources. IAM administrators control who can be *authenticated* (signed in) and *authorized* (have permissions) to use AWS resources. IAM is an AWS service that you can use with no additional charge.

Topics

- Audience
- Authenticating with identities
- Managing access using policies
- How AWS services work with IAM
- Troubleshooting AWS identity and access

Audience

How you use AWS Identity and Access Management (IAM) differs, depending on the work that you do in AWS.

Service user – If you use AWS services to do your job, then your administrator provides you with the credentials and permissions that you need. As you use more AWS features to do your work, you might need additional permissions. Understanding how access is managed can help you request the right permissions from your administrator. If you cannot access a feature in AWS, see Troubleshooting AWS identity and access or the user guide of the AWS service you are using.

Service administrator – If you're in charge of AWS resources at your company, you probably have full access to AWS. It's your job to determine which AWS features and resources your service users should access. You must then submit requests to your IAM administrator to change the permissions of your service users. Review the information on this page to understand the basic concepts of IAM. To learn more about how your company can use IAM with AWS, see the user guide of the AWS service you are using.

IAM administrator – If you're an IAM administrator, you might want to learn details about how you can write policies to manage access to AWS. To view example AWS identity-based policies that you can use in IAM, see the user guide of the AWS service you are using.

Authenticating with identities

Authentication is how you sign in to AWS using your identity credentials. You must be *authenticated* (signed in to AWS) as the AWS account root user, as an IAM user, or by assuming an IAM role.

You can sign in to AWS as a federated identity by using credentials provided through an identity source. AWS IAM Identity Center (IAM Identity Center) users, your company's single sign-on authentication, and your Google or Facebook credentials are examples of federated identities. When you sign in as a federated identity, your administrator previously set up identity federation using IAM roles. When you access AWS by using federation, you are indirectly assuming a role.

Depending on the type of user you are, you can sign in to the AWS Management Console or the AWS access portal. For more information about signing in to AWS, see How to sign in to your AWS account in the *AWS Sign-In User Guide*.

If you access AWS programmatically, AWS provides a software development kit (SDK) and a command line interface (CLI) to cryptographically sign your requests by using your credentials. If you don't use AWS tools, you must sign requests yourself. For more information about using the recommended method to sign requests yourself, see AWS Signature Version 4 for API requests in the *IAM User Guide*.

Regardless of the authentication method that you use, you might be required to provide additional security information. For example, AWS recommends that you use multi-factor authentication (MFA) to increase the security of your account. To learn more, see Multi-factor authentication in the *AWS IAM Identity Center User Guide* and AWS Multi-factor authentication in IAM in the *IAM User Guide*.

AWS account root user

When you create an AWS account, you begin with one sign-in identity that has complete access to all AWS services and resources in the account. This identity is called the AWS account *root user* and is accessed by signing in with the email address and password that you used to create the account. We strongly recommend that you don't use the root user for your everyday tasks. Safeguard your root user credentials and use them to perform the tasks that only the root user can perform. For the complete list of tasks that require you to sign in as the root user, see Tasks that require root user credentials in the *IAM User Guide*.

Federated identity

As a best practice, require human users, including users that require administrator access, to use federation with an identity provider to access AWS services by using temporary credentials.

A *federated identity* is a user from your enterprise user directory, a web identity provider, the AWS Directory Service, the Identity Center directory, or any user that accesses AWS services by using credentials provided through an identity source. When federated identities access AWS accounts, they assume roles, and the roles provide temporary credentials.

For centralized access management, we recommend that you use AWS IAM Identity Center. You can create users and groups in IAM Identity Center, or you can connect and synchronize to a set of users and groups in your own identity source for use across all your AWS accounts and applications. For information about IAM Identity Center, see What is IAM Identity Center? in the *AWS IAM Identity Center User Guide*.

IAM users and groups

An *IAM user* is an identity within your AWS account that has specific permissions for a single person or application. Where possible, we recommend relying on temporary credentials instead of creating IAM users who have long-term credentials such as passwords and access keys. However, if you have specific use cases that require long-term credentials with IAM users, we recommend that you rotate access keys. For more information, see Rotate access keys regularly for use cases that require long-term credentials in the *IAM User Guide*.

An *IAM group* is an identity that specifies a collection of IAM users. You can't sign in as a group. You can use groups to specify permissions for multiple users at a time. Groups make permissions easier to manage for large sets of users. For example, you could have a group named *IAMAdmins* and give that group permissions to administer IAM resources.

Users are different from roles. A user is uniquely associated with one person or application, but a role is intended to be assumable by anyone who needs it. Users have permanent long-term credentials, but roles provide temporary credentials. To learn more, see Use cases for IAM users in the *IAM User Guide*.

IAM roles

An *IAM role* is an identity within your AWS account that has specific permissions. It is similar to an IAM user, but is not associated with a specific person. To temporarily assume an IAM role in the AWS Management Console, you can switch from a user to an IAM role (console). You can assume a role by calling an AWS CLI or AWS API operation or by using a custom URL. For more information about methods for using roles, see Methods to assume a role in the *IAM User Guide*.

IAM roles with temporary credentials are useful in the following situations:

- **Federated user access** – To assign permissions to a federated identity, you create a role and define permissions for the role. When a federated identity authenticates, the identity is associated with the role and is granted the permissions that are defined by the role. For information about roles for federation, see Create a role for a third-party identity provider (federation) in the *IAM User Guide*. If you use IAM Identity Center, you configure a permission set. To control what your identities can access after they authenticate, IAM Identity Center correlates the permission set to a role in IAM. For information about permissions sets, see Permission sets in the *AWS IAM Identity Center User Guide*.
- **Temporary IAM user permissions** – An IAM user or role can assume an IAM role to temporarily take on different permissions for a specific task.
- **Cross-account access** – You can use an IAM role to allow someone (a trusted principal) in a different account to access resources in your account. Roles are the primary way to grant cross-account access. However, with some AWS services, you can attach a policy directly to a resource (instead of using a role as a proxy). To learn the difference between roles and resource-based policies for cross-account access, see Cross account resource access in IAM in the *IAM User Guide*.
- **Cross-service access** – Some AWS services use features in other AWS services. For example, when you make a call in a service, it's common for that service to run applications in Amazon EC2 or store objects in Amazon S3. A service might do this using the calling principal's permissions, using a service role, or using a service-linked role.
  - **Forward access sessions (FAS)** – When you use an IAM user or role to perform actions in AWS, you are considered a principal. When you use some services, you might perform an action that then initiates another action in a different service. FAS uses the permissions of the

principal calling an AWS service, combined with the requesting AWS service to make requests to downstream services. FAS requests are only made when a service receives a request that requires interactions with other AWS services or resources to complete. In this case, you must have permissions to perform both actions. For policy details when making FAS requests, see Forward access sessions.

- **Service role** – A service role is an IAM role that a service assumes to perform actions on your behalf. An IAM administrator can create, modify, and delete a service role from within IAM. For more information, see Create a role to delegate permissions to an AWS service in the *IAM User Guide*.
- **Service-linked role** – A service-linked role is a type of service role that is linked to an AWS service. The service can assume the role to perform an action on your behalf. Service-linked roles appear in your AWS account and are owned by the service. An IAM administrator can view, but not edit the permissions for service-linked roles.

- **Applications running on Amazon EC2** – You can use an IAM role to manage temporary credentials for applications that are running on an EC2 instance and making AWS CLI or AWS API requests. This is preferable to storing access keys within the EC2 instance. To assign an AWS role to an EC2 instance and make it available to all of its applications, you create an instance profile that is attached to the instance. An instance profile contains the role and enables programs that are running on the EC2 instance to get temporary credentials. For more information, see Use an IAM role to grant permissions to applications running on Amazon EC2 instances in the *IAM User Guide*.

Managing access using policies

You control access in AWS by creating policies and attaching them to AWS identities or resources. A policy is an object in AWS that, when associated with an identity or resource, defines their permissions. AWS evaluates these policies when a principal (user, root user, or role session) makes a request. Permissions in the policies determine whether the request is allowed or denied. Most policies are stored in AWS as JSON documents. For more information about the structure and contents of JSON policy documents, see Overview of JSON policies in the *IAM User Guide*.

Administrators can use AWS JSON policies to specify who has access to what. That is, which **principal** can perform **actions** on what **resources**, and under what **conditions**.

By default, users and roles have no permissions. To grant users permission to perform actions on the resources that they need, an IAM administrator can create IAM policies. The administrator can then add the IAM policies to roles, and users can assume the roles.

IAM policies define permissions for an action regardless of the method that you use to perform the operation. For example, suppose that you have a policy that allows the `iam:GetRole` action. A user with that policy can get role information from the AWS Management Console, the AWS CLI, or the AWS API.

Identity-based policies

Identity-based policies are JSON permissions policy documents that you can attach to an identity, such as an IAM user, group of users, or role. These policies control what actions users and roles can perform, on which resources, and under what conditions. To learn how to create an identity-based policy, see Define custom IAM permissions with customer managed policies in the *IAM User Guide*.

Identity-based policies can be further categorized as *inline policies* or *managed policies*. Inline policies are embedded directly into a single user, group, or role. Managed policies are standalone policies that you can attach to multiple users, groups, and roles in your AWS account. Managed policies include AWS managed policies and customer managed policies. To learn how to choose between a managed policy or an inline policy, see Choose between managed policies and inline policies in the *IAM User Guide*.

Resource-based policies

Resource-based policies are JSON policy documents that you attach to a resource. Examples of resource-based policies are IAM *role trust policies* and Amazon S3 *bucket policies*. In services that support resource-based policies, service administrators can use them to control access to a specific resource. For the resource where the policy is attached, the policy defines what actions a specified principal can perform on that resource and under what conditions. You must specify a principal in a resource-based policy. Principals can include accounts, users, roles, federated users, or AWS services.

Resource-based policies are inline policies that are located in that service. You can't use AWS managed policies from IAM in a resource-based policy.

Access control lists (ACLs)

Access control lists (ACLs) control which principals (account members, users, or roles) have permissions to access a resource. ACLs are similar to resource-based policies, although they do not use the JSON policy document format.

Amazon S3, AWS WAF, and Amazon VPC are examples of services that support ACLs. To learn more about ACLs, see Access control list (ACL) overview in the *Amazon Simple Storage Service Developer Guide*.

Other policy types

AWS supports additional, less-common policy types. These policy types can set the maximum permissions granted to you by the more common policy types.

- **Permissions boundaries** – A permissions boundary is an advanced feature in which you set the maximum permissions that an identity-based policy can grant to an IAM entity (IAM user or role). You can set a permissions boundary for an entity. The resulting permissions are the intersection of an entity's identity-based policies and its permissions boundaries. Resource-based policies that specify the user or role in the `Principal` field are not limited by the permissions boundary. An explicit deny in any of these policies overrides the allow. For more information about permissions boundaries, see Permissions boundaries for IAM entities in the *IAM User Guide*.
- **Service control policies (SCPs)** – SCPs are JSON policies that specify the maximum permissions for an organization or organizational unit (OU) in AWS Organizations. AWS Organizations is a service for grouping and centrally managing multiple AWS accounts that your business owns. If you enable all features in an organization, then you can apply service control policies (SCPs) to any or all of your accounts. The SCP limits permissions for entities in member accounts, including each AWS account root user. For more information about Organizations and SCPs, see Service control policies in the *AWS Organizations User Guide*.
- **Resource control policies (RCPs)** – RCPs are JSON policies that you can use to set the maximum available permissions for resources in your accounts without updating the IAM policies attached to each resource that you own. The RCP limits permissions for resources in member accounts and can impact the effective permissions for identities, including the AWS account root user, regardless of whether they belong to your organization. For more information about Organizations and RCPs, including a list of AWS services that support RCPs, see Resource control policies (RCPs) in the *AWS Organizations User Guide*.
- **Session policies** – Session policies are advanced policies that you pass as a parameter when you programmatically create a temporary session for a role or federated user. The resulting session's permissions are the intersection of the user or role's identity-based policies and the session policies. Permissions can also come from a resource-based policy. An explicit deny in any of these policies overrides the allow. For more information, see Session policies in the *IAM User Guide*.

Multiple policy types

When multiple types of policies apply to a request, the resulting permissions are more complicated to understand. To learn how AWS determines whether to allow a request when multiple policy types are involved, see Policy evaluation logic in the *IAM User Guide*.

How AWS services work with IAM

To get a high-level view of how AWS services work with most IAM features, see AWS services that work with IAM in the *IAM User Guide*.

To learn how to use a specific AWS service with IAM, see the security section of the relevant service's User Guide.

Troubleshooting AWS identity and access

Use the following information to help you diagnose and fix common issues that you might encounter when working with AWS and IAM.

Topics

- I am not authorized to perform an action in AWS
- I am not authorized to perform iam:PassRole
- I want to allow people outside of my AWS account to access my AWS resources

I am not authorized to perform an action in AWS

If you receive an error that you're not authorized to perform an action, your policies must be updated to allow you to perform the action.

The following example error occurs when the `mateojackson` IAM user tries to use the console to view details about a fictional *`my-example-widget`* resource but doesn't have the fictional `awes:`*`GetWidget`* permissions.

```
User: arn:aws:iam::123456789012:user/mateojackson is not authorized to perform:
 awes:GetWidget on resource: my-example-widget
```

In this case, the policy for the `mateojackson` user must be updated to allow access to the *`my-example-widget`* resource by using the `awes:`*`GetWidget`* action.

If you need help, contact your AWS administrator. Your administrator is the person who provided you with your sign-in credentials.

I am not authorized to perform iam:PassRole

If you receive an error that you're not authorized to perform the `iam:PassRole` action, your policies must be updated to allow you to pass a role to AWS.

Some AWS services allow you to pass an existing role to that service instead of creating a new service role or service-linked role. To do this, you must have permissions to pass the role to the service.

The following example error occurs when an IAM user named `marymajor` tries to use the console to perform an action in AWS. However, the action requires the service to have permissions that are granted by a service role. Mary does not have permissions to pass the role to the service.

```
User: arn:aws:iam::123456789012:user/marymajor is not authorized to perform:
 iam:PassRole
```

In this case, Mary's policies must be updated to allow her to perform the `iam:PassRole` action.

If you need help, contact your AWS administrator. Your administrator is the person who provided you with your sign-in credentials.

I want to allow people outside of my AWS account to access my AWS resources

You can create a role that users in other accounts or people outside of your organization can use to access your resources. You can specify who is trusted to assume the role. For services that support resource-based policies or access control lists (ACLs), you can use those policies to grant people access to your resources.

To learn more, consult the following:

- To learn whether AWS supports these features, see How AWS services work with IAM.
- To learn how to provide access to your resources across AWS accounts that you own, see Providing access to an IAM user in another AWS account that you own in the *IAM User Guide*.
- To learn how to provide access to your resources to third-party AWS accounts, see Providing access to AWS accounts owned by third parties in the *IAM User Guide*.
- To learn how to provide access through identity federation, see Providing access to externally authenticated users (identity federation) in the *IAM User Guide*.

- To learn the difference between using roles and resource-based policies for cross-account access, see Cross account resource access in IAM in the *IAM User Guide*.

Compliance Validation for this AWS Product or Service

To learn whether an AWS service is within the scope of specific compliance programs, see AWS services in Scope by Compliance Program and choose the compliance program that you are interested in. For general information, see AWS Compliance Programs.

You can download third-party audit reports using AWS Artifact. For more information, see Downloading Reports in AWS Artifact.

Your compliance responsibility when using AWS services is determined by the sensitivity of your data, your company's compliance objectives, and applicable laws and regulations. AWS provides the following resources to help with compliance:

- Security Compliance & Governance – These solution implementation guides discuss architectural considerations and provide steps for deploying security and compliance features.
- HIPAA Eligible Services Reference – Lists HIPAA eligible services. Not all AWS services are HIPAA eligible.
- AWS Compliance Resources – This collection of workbooks and guides might apply to your industry and location.
- AWS Customer Compliance Guides – Understand the shared responsibility model through the lens of compliance. The guides summarize the best practices for securing AWS services and map the guidance to security controls across multiple frameworks (including National Institute of Standards and Technology (NIST), Payment Card Industry Security Standards Council (PCI), and International Organization for Standardization (ISO)).
- Evaluating Resources with Rules in the *AWS Config Developer Guide* – The AWS Config service assesses how well your resource configurations comply with internal practices, industry guidelines, and regulations.
- AWS Security Hub – This AWS service provides a comprehensive view of your security state within AWS. Security Hub uses security controls to evaluate your AWS resources and to check your compliance against security industry standards and best practices. For a list of supported services and controls, see Security Hub controls reference.
- Amazon GuardDuty – This AWS service detects potential threats to your AWS accounts, workloads, containers, and data by monitoring your environment for suspicious and malicious

activities. GuardDuty can help you address various compliance requirements, like PCI DSS, by meeting intrusion detection requirements mandated by certain compliance frameworks.

- AWS Audit Manager – This AWS service helps you continuously audit your AWS usage to simplify how you manage risk and compliance with regulations and industry standards.

This AWS product or service follows the shared responsibility model through the specific Amazon Web Services (AWS) services it supports. For AWS service security information, see the AWS service security documentation page and AWS services that are in scope of AWS compliance efforts by compliance program.

Resilience for this AWS Product or Service

The AWS global infrastructure is built around AWS Regions and Availability Zones.

AWS Regions provide multiple physically separated and isolated Availability Zones, which are connected with low-latency, high-throughput, and highly redundant networking.

With Availability Zones, you can design and operate applications and databases that automatically fail over between zones without interruption. Availability Zones are more highly available, fault tolerant, and scalable than traditional single or multiple data center infrastructures.

For more information about AWS Regions and Availability Zones, see AWS Global Infrastructure.

This AWS product or service follows the shared responsibility model through the specific Amazon Web Services (AWS) services it supports. For AWS service security information, see the AWS service security documentation page and AWS services that are in scope of AWS compliance efforts by compliance program.

Infrastructure Security for this AWS Product or Service

This AWS product or service uses managed services, and therefore is protected by the AWS global network security. For information about AWS security services and how AWS protects infrastructure, see AWS Cloud Security. To design your AWS environment using the best practices for infrastructure security, see Infrastructure Protection in *Security Pillar AWS Well-Architected Framework*.

You use AWS published API calls to access this AWS Product or Service through the network. Clients must support the following:

- Transport Layer Security (TLS). We require TLS 1.2 and recommend TLS 1.3.
- Cipher suites with perfect forward secrecy (PFS) such as DHE (Ephemeral Diffie-Hellman) or ECDHE (Elliptic Curve Ephemeral Diffie-Hellman). Most modern systems such as Java 7 and later support these modes.

Additionally, requests must be signed by using an access key ID and a secret access key that is associated with an IAM principal. Or you can use the AWS Security Token Service (AWS STS) to generate temporary security credentials to sign requests.

This AWS product or service follows the shared responsibility model through the specific Amazon Web Services (AWS) services it supports. For AWS service security information, see the AWS service security documentation page and AWS services that are in scope of AWS compliance efforts by compliance program.

OpenPGP key for the AWS SDK for Java

All publicly available Maven artifacts for the AWS SDK for Java are signed using the OpenPGP standard. The public key that you need to verify the signature of an artifact is available in the following section.

Current key

The following table shows OpenPGP key information for the current releases of the SDK for Java 1x and SDK for Java 2.x.

Key ID	0xAC107B386692DADD
Type	RSA
Size	4096/4096
Created	2016-06-30
Expires	**2025-10-04**
User ID	AWS SDKs and Tools <aws-dr-tools@amazon.com>
Key fingerprint	FEB9 209F 2F2F 3F46 6484 1E55 AC10 7B38 6692 DADD

To copy the following OpenPGP public key for the SDK for Java to the clipboard, select the "Copy" icon in the upper right corner.

Historical keys

> **Important**
>
> New keys are created before the previous ones expire. As a result, at any given moment in time, more than one key may be valid. Keys are used to sign artifacts starting the day they are created, so use the more recently-issued key when the validities of keys overlap.

The following table shows older OpenPGP key information for releases of the SDK for Java 1x and SDK for Java 2.x.

Key ID	0xAC107B386692DADD
Type	RSA
Size	4096/4096
Created	2016-06-30
Expires	2024-10-08
User ID	AWS SDKs and Tools <aws-dr-tools@amazon.com>
Key fingerprint	FEB9 209F 2F2F 3F46 6484 1E55 AC10 7B38 6692 DADD

To copy the following OpenPGP public key for the SDK for Java to the clipboard, select the "Copy" icon in the upper right corner.

Document history

This topic describes important changes to the AWS SDK for Java Developer Guide over the course of its history.

Change	Description	Date
Transfer Manager	Added comprehensive migration tables for client constructors, methods, model objects, and behavior changes. Included detailed code examples for unsupported methods requiring manual migration.	July 1, 2025
Metrics	Added comprehensive documentation for `LoggingMetricPublisher`. Restructured the metrics topic with improved getting-started guidance.	June 20, 2025
the section called “High-level changes”	Added information about empty string handling differences between `DynamoDBMapper` (v1) and DynamoDB Enhanced Client (v2) in the migration guide.	June 18, 2025
Table of contents reorganization	??? chapter was added and topics were moved to it from other parts of the guide.	June 16, 2025
???	Added information about using the `LegacyMd5Plugin` for backward	May 19, 2025

Change	Description	Date
	compatibility with systems that require MD5 checksums.	
the section called “S3 client differences”	Add S3 client differenc es between v1 and v2 of the AWS SDK for Java and provide migration examples if the migration tool cannot automatically migrate the V1 code.	April 24, 2025
Deserialization differences	Add deserialization differenc e between v1 and v2 of the SDK for Java.	April 10, 2025
the section called “SQS automatic request batching”	Add migration content for SQS automatic request batching from v1 to v2 of the SDK for Java.	April 8, 2025
???	Update information about automatic checksum calculati ons	April 3, 2025
the section called “Configure ALPN”	Show configuration of ALPN protocol negotiation with the Netty-based HTTP client.	February 21, 2025
the section called “Lambda functions”	Add information about using the EMF logging metric publisher with AWS Lambda to capture SDK metrics.	February 6, 2025
Implement `ContentSt reamProvider`	Add topic on how to implement a `ContentSt reamProvider` .	January 29, 2025

Change	Description	Date
the section called “Data integrity protection with checksums”	Content updated with details about automatic checksum calculation.	January 16, 2025
the section called “Working with Amazon S3”	Add migration content for working with Amazon S3.	January 8, 2025
the section called “Access the AWS CRT-based HTTP clients”	Add information about how to used a platform-specific jar with AWS CRT-based components.	November 14, 2024
the section called “Use IAM Roles Anywhere for authentication”	Add information about how to use IAM Roles Anywhere for authentication.	November 6, 2024
the section called “Caching credentials configuration example”	Add an example that configures a credentials provider by using the `asyncCredentialUpdateEnabled` property.	November 4, 2024
the section called “Use automatic request batching”	Add a new topic that documents the Automatic Request Batching API for Amazon SQS.	October 23, 2024
OpenPGP key	Update current OpenPGP key information.	October 10, 2024
the section called “Use complex types in expressions” and the section called “Update items that contain complex types”	Add content for how to work with complex types in expressions and updates.	October 10, 2024

Change	Description	Date
Update Amazon S3 bucket names	Update Amazon S3 bucket names.	September 30, 2024
the section called “Use AWS account-based endpoints”	Add information about AWS account-based endpoints for DynamoDB.	September 24, 2024
the section called “Work with attributes that are beans, maps, lists and sets”	Update section for DynamoDB Enhance Client that discusses working with attributes that are complex types.	September 6, 2024
the section called “Configure service clients to shortcut lookups”	Clarify use of the `EnvironmentVariableCredentialsProvider` when Lambda SnapStart for Java is used.	August 19, 2024
the section called “Configure parallel transfer support”	Add page with information on how to enable parallel transfer support	August 15, 2024
the section called “AutoGeneratedUuidExtension”	Add information about the DynamoDB Enhanced Client `AutoGeneratedUuidExtension`	August 14, 2024
???	Add a section about the migration tool (preview release)	August 9, 2024
the section called “S3 Event Notifications”	Add section that discusses how to work with the S3 Event Notifications API	July 21, 2024

Change	Description	Date
the section called “DynamoDB mapping/document APIs”	Add v1 to v2 migration information for the DynamoDB mapping/document APIs	July 21, 2024
the section called “S3 Event Notifications”	Add v1 to b2 migration information for the S3 Event Notifications API	July 21, 2024
the section called “Retries”	Add retry strategy topic	June 18, 2024
How to set the JVM TTL	Remove instructions to set `networkaddress.cache.ttl` security property by using a java command-line system property.	May 21, 2024
the section called “Reduce SDK startup time for AWS Lambda”	Update HTTP client recommendation to reduce startup time for AWS Lambda	May 14, 2024
the section called “Metrics reference”	Reorganize metrics table items	May 1, 2024
the section called “Troubleshooting”	Add troubleshooting topic.	April 26, 2024
the section called “Metrics collected with each request”	Add new metrics reported by the SDK.	April 26, 2024
the section called “Set the JVM TTL for DNS name lookups”	Change recommended DNS lookup TTL to 5 seconds.	April 23, 2024
the section called “Package name to artifactId mappings”	Add package name to Maven artifactId mapping topic.	April 17, 2024

Change	Description	Date
the section called “Metrics”	Add configuration details to the metrics section.	April 12, 2024
the section called “IAM Policy Builder API”	Add IAM Policy Builder API migration information.	April 11, 2024
???	Update HTTP proxy informati on.	April 3, 2024
the section called “Securely”	Add instructions to disable IMDSv1.	March 14, 2024
the section called “Step-by-step instructions”	Add step-by-step migration instructions.	March 8, 2024
Migrate to version 2	Update migration topic.	February, 14, 2024
the section called “Configure AWS CRT-based HTTP clients”	Add information about the synchronous AWS CRT-based HTTP client.	January 5, 2024
the section called “Amazon Cognito Identity” and the section called “Amazon Cognito Identity Provider”	Amazon Cognito examples moved to Code Examples section.	December 28, 2023
OpenPGP key	Provide current OpenPGP key.	December 6, 2023
the section called “Serializ ation differences”	Describe serialization differences between v1 and v2 of the SDK for Java.	December 5, 2023
the section called “Transfer Manager”	Add a section that details the changes in the S3 Transfer Manager from version 1 to version 2.	November 13, 2023

Change	Description	Date
the section called “Annotation reference”	Add a listing of data class annotations that can be used with the DynamoDB Enhanced Client.	October 30, 2023
???	Add information on the migration status of libraries and utilities from SDK for Java v1.x to v2.x	October 17, 2023
???	Update the Gradle setup topic	October 17, 2023
the section called “Ignore null attributes of nested objects”	Add information about the DynamoDB Enhanced Client `@DynamoDbIgnoreNulls` annotation.	September 22, 2023
the section called “Cross-Region access”	Add information about cross-Region access to Amazon S3 buckets.	August 31, 2023
the section called “Preserve empty objects”	Add section that discusses the `@DynamoDbPreserveEmptyObject` annotation.	August 25, 2023
???	Update service client section.	August 15, 2023
the section called “Client recommendations”	Since version 0.23, AWS CRT supports musl-based OS such as Alpine Linux. HTTP client recommendations now reflect the musl support.	August 11, 2023
the section called “Create IAM policies”	Add IAM Policy Builder API section	July 31, 2023

Change	Description	Date
the section called “Get started”	Correct several snippets in the Get Started section of the DynamoDB Enhanced Client topic.	July 24, 2023
the section called “Configure HTTP proxies”	Add HTTP proxy support information and examples for each HTTP client.	June 2, 2023
Reorganize the table of contents	Promote *Code examples* section and *Calling AWS services* to top-level TOC entries.	May 24, 2023
the section called “Add logging dependency”	Show Gradle dependencies in logging section.	May 23, 2023
the section called “Pagination”	Update pagination topic.	May 18, 2023
the section called “Set up a Gradle project”	Update Gradle project setup.	May 3, 2023
DynamoDB Enhanced Client API	Rewritten DynamoDB Enhanced Client API topic released.	April 28, 2023
Update get started tutorial instructions	Maven archetype modified to include option for credentialsProvider; instructions modified accordingly.	April 11, 2023
the section called “Client recommendations”	Add HTTP client decision guidance	March 30, 2023

Change	Description	Date
IAM best practices updates	Updated guide to align with the IAM best practices . For more information, see Security best practices in IAM.	March 14, 2023
the section called “Reload profile credentials”	Add section on reloading profile credentials.	February 9, 2023
the section called “Configure AWS CRT-based HTTP clients”	Update topic for GA release.	February 8, 2023
the section called “Work with Amazon EC2 instance metadata”	Add guided example for Java SDK client for Amazon S3 instance metadata service.	February 1, 2023
the section called “Use a performant S3 client”	Add section for the AWS CRT-based S3 Client.	December 19, 2022
the section called “Transfer files and directories”	Update Amazon S3 Transfer Manager examples for GA release.	December 19, 2022
the section called “Best practices”	Added best practices section.	November 18, 2022
the section called “Use an external process”	Added section on loading credentials from an external process.	November 15, 2022
the section called “Metrics reference”	Updated metric listing with HTTP client usage requirement.	November 9, 2022
the section called “Transfer files and directories”	Example code corrected.	November 2, 2022

Change	Description	Date
the section called “Reduce SDK startup time for AWS Lambda”	Updated section with additional options to reduce Lambda startup time.	November 1, 2022
the section called “Configure HTTP clients”	Added configuration information to cover all HTTP clients in the SDK.	October 26, 2022
the section called “Logging”	Updated logging topic to include wire logging details for all HTTP clients.	October 4, 2022
the section called “AWS database services”	Added overview section of AWS database services and the SDK for Java 2.x.	September 13, 2022
EC2-Classic Networking is Retiring	EC2-Classic is retiring on August 15, 2022.	July 28, 2022
the section called “Additional authentication options”	Update to dependency required for single sign-on authentication.	July 18, 2022
the section called “Transport Layer Security (TLS)”	Update TLS security informati on.	April 8, 2022
the section called “Additional authentication options”	Added more information about setting up and using credentials.	February 22, 2021
the section called “Set up a GraalVM Native Image project”	New topic for setting up a GraalVM Native Image project.	February 18, 2021
the section called “Waiters”	Waiters released; added topic for the new feature.	September 30, 2020

Change	Description	Date
the section called “Metrics”	Metrics released; added topic for the new feature.	August 17, 2020
the section called “Amazon SNS”	Added example topics for Amazon SNS.	May 30, 2020
the section called “Reduce SDK startup time for AWS Lambda”	Added AWS Lambda function performance topic.	May 29, 2020
the section called “Set the JVM TTL for DNS name lookups”	Added JVM TTL DNS caching topic.	April 27, 2020
the section called “Set up an Apache Maven project”, the section called “Set up a Gradle project”	New Maven and Gradle set up topics.	April 21, 2020
the section called “Transport Layer Security (TLS)”	Added TLS 1.2 to security section.	March 19, 2020
the section called “Subscribe to Amazon Kinesis Data Streams”	Added Kinesis stream examples.	August 2, 2018
the section called “Pagination”	Added auto pagination topic.	April 5, 2018
???	Added example topics for IAM, Amazon EC2, CloudWatch and DynamoDB.	December 29, 2017
the section called “Amazon S3”	Added getobjects example for Amazon S3.	August 7, 2017

Change	Description	Date
the section called “Asynchronous programming”	Added async topic.	August 4, 2017
GA release of the AWS SDK for Java 2.x	AWS SDK for Java version 2 (v2) released.	June 28, 2017
